## Looking Back.

**E**VERY industry has received its test of strength during the war period, the motor cycle trade being no exception. Therefore a review of the conditions existing in the motor cycle world since the commencement of war is interesting at this juncture. Mistakes and blunders there have been in plenty, hence our reason for a recital of the trials and vicissitudes through which the trade has passed during the last eighteen months. At the outbreak of war we recollect that firms, seized with the panic which, perhaps, naturally pervaded the atmosphere at that time, commenced cancelling contracts in the expectancy of bad times, and, moreover, cut down staffs and encouraged many of their best engineers to join the Forces. It is common knowledge what the resultant effect of all this chaos was in a country unprepared for war on land, and it will be profitable to some to consider how the trade subsequently extricated itself from this difficult position.

A month after war had been in progress, when the cry was "Carry on," we felt it our duty to urge manufacturers to consider the advisability of continuing to build motor cycles in reasonable quantities with a view to taking them into stock, reminding manufacturers that the trade had not for many years past been in the advantageous position compared with foreign rivals of being able to give delivery without some weeks delay. Some heeded our advice, and profited greatly as a result when the Russian Government a month or two later came along and purchased practically all the motor cycles it could lay its hands on. In any case, our Overseas markets would gladly have snapped up any surplus stock, had it been available. Other firms cut down their contracts for raw material to fine limits and continued in a very small way until the trade, gradually deprived of machine tools and a great number of workmen, found itself quite unable to cope with the sudden demand in the spring. At this point frantic efforts were made by manufacturers to

obtain the stocks of raw material which a month or two previously they had refused to accept, but the efforts were largely in vain, as raw material suppliers, too, had been disorganised by the cancellations and had allowed their skilled men to join the Colours. Hence an all-round jump in prices. To turn away for the moment from the business side to the most regrettable side of the matter, during those early months of the war motor manufacturers were not encouraged by the Government—indeed, they were in many cases discouraged—in their offers to utilise their plant for the manufacture of the very necessary munitions of war, the lack of which at a later date was to prove a real hindrance to the success of our arms. Whilst Government orders were being sought in vain, manufacturers were unable to take advantage of the brisk demand which had sprung up by reason of gold circulating freely, they themselves having been hampered by their injudicious action in cancelling contracts at the very outbreak of war, the supply of raw material as a consequence having been thoroughly upset, and those supplies which were available commandeered by the Government.

## The Absence of a Leader.

It is a disheartening tale of lost opportunities, we admit, all due to the absence of a "leader." Motor firms being unsuccessful in their efforts to obtain regular orders, were obliged gradually to release men who had formed the backbone of their business, yet we find in *The Motor Cycle* of November 12th, 1914, a leaderette pointing out what a national asset the motor trade could prove. The heading to this article was "Bred in Peace, but Invaluable in War," and it was urged that the motor trade, being one of the most advanced in mechanical engineering, employing a highly-trained and specialised body of mechanics, could prove of inestimable value to the Government in special engineering work (obviously shells and aeroplane parts were referred to). But the Government were by no means alive to this position, and it was not until

**Looking Back.—**

many valuable months had been wasted, and when the exodus of skilled workmen had reached alarming proportions, that the Government came to the same conclusion that we had arrived at six months previously.

Again, in scoffing at the Board of Trade's insistent appeals to "capture enemy trade" when firms could not get raw material enough to satisfy home demands, and were, moreover, being abused for not making munitions, and their skilled men urged to enlist, *The Motor Cycle* said:

"It seems too much to hope that the Government are in a position to co-ordinate all the industries which can be pressed into their service in the supply of munitions of war, but those firms not so employed should certainly know at once whether or not they are right in treating seriously the suggestions of the Board of Trade. The matter is more serious than it seems at first sight. Enough has not been made of the present indefinite and unsatisfactory state of affairs. Why? Because manufacturers, who one by one have been taken off their ordinary work and diverted on to Government work, have made no complaint."

The remainder of the tale is common knowledge. Skilled men have had to be fetched back from the trenches after months wasted in training, and the Minister of Munitions himself asserts that we have still to catch up with our requirements in the matter of munitions.

### The Pay of Army Motor Cyclists and Car Drivers.

**N**ATURALLY enough, there has been a great deal of ill-feeling concerning the divergent rates of pay of men in His Majesty's Forces. For instance, men in the trenches wielding the bayonet receive a 1s. or so a day, whilst car drivers, who have comparatively comfortable jobs, are paid as much as 6s. per day. In the Motor Machine

Gun Service, whereas the motor cyclists get 1s. 2½d. per day, the car drivers working alongside the motor cyclists get five times as much. Motor cyclists employed as despatch riders get 2s. 6d. and 3s. per day. Last spring we drew attention to these anomalies, and urged a standard rate of pay of 3s. per day for car drivers and motor cyclists, for which we received many appreciative letters from readers on active service. Subsequently Mr. W. F. Perkins, the member for the New Forest Division of Hampshire, took up the question, we had raised, in Parliament, but Mr. H. Baker, who replied, defended the position. However, it was clear that this unsatisfactory state of affairs could not continue for long. In the interim another few million pounds have been paid out, and an important announcement is now forthcoming to the effect that the 6s. per day rate will not be paid in future to car drivers. The statement was contained in the Paymaster-General's answer to a question in the House of Lords last week:

"Lord Newton (Paymaster-General) informed Lord Haversham, with reference to the six shillings a day paid to some of our drivers of military motor lorries in France, while other drivers are receiving only fourteen pence per day, that men receiving the higher rate could not be replaced by others obtaining the lower rate, because time did not permit recruits to gain sufficient experience to take entire charge of motor vehicles. There were already large numbers of drivers at fourteen pence a day, but the number of men now being trained was barely enough to meet the increased needs of the Army. No more men would, however, be taken on at the higher pay."

As is well known, recruiting for car drivers for the A.S.C. has been closed for some time, but men of military age physically unfit for the combatant sections, and men between 40 and 45 years of age are now being accepted as learner-drivers at 1s. 2d. per day, this rate of pay being doubled on the learner becoming proficient.

## OCCASIONAL

## COMMENTS

By "IXION"

Sydney R. Jones

**Springing.**

Some firms imagine they have solved the springing problem when they fit their front forks with coiled springs capable of perhaps 2in. of compression. Far be it from me to say a word against these and similar devices as temporary makeshifts. They are streets ahead of the old rigid fork, and we owe it to such elasticity as they possess, to their cheapness, and to their simplicity that motor cycling has been possible. But it is folly to dream that they solve the problem. Last week I was out on a certain light car which has three-quarter elliptic springs astern with 8in. of vertical clearance at their centres. These springs flattened out absolutely flat on several occasions during a long run over roads which have lain unrepaired since August, 1914, and have borne considerable artillery and lorry traffic in the interim. I daresay it takes a very bad road indeed to deflect a motor cycle wheel 8in. in the vertical line, but it is probable that we require springs with at least 5in. of motion; and it is questionable whether there is a fork of the coiled spring type in existence which affords more than 2in. If our needs are as indicated, what price the Overseas rider?

**Flywheel Dynamo Drive.**

I notice more in sorrow than in anger that several electrical firms are marketing lighting dynamos driven by friction off the tyre or wheel rim. I quite accept the situation. The demand for motor cycle dynamos is still small, and anybody who wants to earn the cost of his blue prints in the early stages of a new industry must market a device adaptable to all machines. Still, it is obvious that the tyre drive will require very heavy pressure, and as for the rim drive, I should be vastly surprised to hear that any motor cycle rim remains even approximately true after 5,000 miles of work. I know I am a bit of a "highway incinerator," to quote the latest Yankee slang for a speed merchant, and I usually spend an hour or two banging kinks out of my rims after a summer on the road. So a word to the No. 8 size hats who design dynamos—a word in all humility, since the intricacies of their circuits show that they are plainly men of brain and intellect. Please remember that an increasing number of us are using machines with outside flywheels. Here is a true, always dry, never oily, and very suitably located rotary member of many thousand motor cycles, off which your little rubber dynamo friction wheels could get a far, far better drive than they have ever done. This particular type of dynamo is very compact, and would lie snugly along the intermediate frame tube, under the tank. The Douglas market alone is well worth tapping with a notion on these lines; and the baby two-stroke is simply whimpering for it; so please weigh in with a few samples.

**Dry Battery Lighting.**

My promised report of the dry battery lighting system is deferred *sine die*, for the miserable tin cases supplied by the vendors for holding their treble accursed batteries have all opened automatically at speed on the road and deposited the half-exhausted cells somewhere between Nottingham and Coventry. Moreover, the unconscious loss doomed me to an uncomfortable night at a malodorous and fleasome roadside hostelry, near which my loss was first discovered as the gloaming drew in. Fortunately, I am of a forgiving disposition, and have purchased a couple of new batteries, which are now securely strapped into the aforesaid tin receptacles. The warning may save others from similar losses. I doubt whether the designers of these sets, so attractive in theory, genuinely realise the nature of the stresses to which motor cycle fitments are subjected, even on a baby two-stroke. The wiring is not sufficiently substantial; the lamp details are scarcely heavy enough; the battery box clips need an extra nut apiece, plus burring over with a file, hammer, or hacksaw; and so forth. However, I have often suffered gladly as martyr in a noble cause; and I will face further mishaps in the hope my reports may enable the various vendors to turn out a really roadworthy set in the near future.

**A Rum Start.**

The other day I was nicely caught out by a very cold day, which I struck in thinish attire with a baby two-stroke beneath me. I rather plume myself on lightning diagnoses, but my brain was numb with frost, and quite a time elapsed before I realised what was amiss. The machine would start from stone cold as easily as Charlie Collier's tuned racer when readied for a world's standing mile record; but when it was warm it could hardly be induced to start at any price. To my snug readers in armchairs, their cerebral tissues nicely warmed by Christmas toddy, the solution will, of course, appear instantaneously. The carburetter was flooding slightly. Thus a very rich mixture was available for the cold start; but as the air supply warmed up, the proportion of petrol became excessive and starting was difficult. There is this to be said in my defence, that a four-stroke would behave slightly differently, and I had never previously struck this particular trouble on a two-stroke. Under similar conditions, a four-stroke would not start properly from cold, but would thump very heavily and refuse to get away, probably stopping as soon as the load was thrown on the engine. But a two-stroke asks for a very rich mixture for a cold start, so it would get away nicely from cold. I do not think there is any other conceivable diagnosis.

**I**N the past we have had articles championing various types of machines as the best general utility machine. This article is an attempt to take up the cudgels on behalf of the  $3\frac{1}{2}$  h.p. T.T. single. My justification is a mileage of 20,000 miles contributed to by three machines all of this type. All my three machines have been Nortons, and all have given excellent service.

A brief specification of the three machines may be of interest. No. 1 was a 1911  $3\frac{1}{2}$  h.p.  $82 \times 94$  bought second-hand from a Lancashire firm. It had a long wheelbase (56in.) and single gear. This length of wheelbase gave very comfortable riding on bad roads, very fine steering, and a confidence inspiring stability on greasy roads.

I fitted a Binks three-jet carburetter to this machine and got a very good mileage per gallon and wonderful flexibility.

I used Norton No. 1 principally in central Scotland and also spent a holiday in the Isle of Man on it during the 1914 T.T. week. I was very pleased with its performance on the climb from Ramsey and the Bungalow on the classic course on the one occasion on which I rode up there. The only trouble I experienced was the belt rim coming adrift on three occasions. This belt rim was held to the rim by a number of short spokes placed between the wheel spokes. This feature has been altered on later models.

Norton No. 2 was a 1914  $3\frac{1}{2}$  h.p. T.T.  $79 \times 100$  mm., bought in June, 1914. It also had a 56in. wheel-

Double ignition system showing single point plug in cylinder head.

base, like its predecessor, and to this feature I attribute its marked road-worthiness. I used a three-jet Binks carburetter and got great satisfaction from it. My only objections to this instrument are, firstly, I found it tiring to manipulate the long stiff levers over a long run, and,

secondly, I was troubled with wire breakages. I hope Mr. Binks will pardon this criticism of his otherwise excellent instrument.

A Philipson governor pulley was the only gear used, and with its aid the machine climbed some alleged roads in Glamorganshire and Breconshire, where no motor cycle had ever been before.

## Firing at Two Points.

I experimented for some time with double ignition, using for the purpose a Lodge double-pole plug over the inlet valve and a single-point Bosch in the centre of the cylinder head. With this fitting I found starting was very easy. One pull of the back wheel with the machine on the stand would start the engine from cold at any time if care were taken that the pull was sharp during the induction stroke. Power on hills was increased for a given throttle opening, but, unless carefully driven, knocking occurred readily.

Small point at side filed off, and central electrode bent over, making a single point plug.

Driven all out, pre-ignition became noticeable after half a milé. This I traced to the rather thin points of the double pole plug becoming incandescent. This machine was used for my work as a medical practitioner in a hilly district in South Wales. The frequent stops necessitated by my work, the steep narrow tracks, and rough surfaces encountered, made severe demands respectively on the easy starting, hill-climbing, and roadworthy abilities of my machine. In addition, the excellent spring-up stand beloved of "Ixion" was, perhaps, the finest possible fitment for a doctor's mount.

Norton No. 3 was a 1915 Brooklands Road Special; a  $79 \times 100$  mm., 490 c.c.,  $3\frac{1}{2}$  h.p. engine fitted in a 54in. frame, with a dropped top tube instead of the straight one previously favoured by Mr. Norton.

I have tried various carburetters on it, and at present it is fitted with a Senspray.

A variable pulley gear fitted gave good service, but being severe on the average rubber belt, I substituted for it a Philipson pulley and fitted up a handle-bar control. This gave a very fine variable gear, and I have yet to find the ordinary road hill that I cannot climb. Belt wear has been slight. Harcourt radiators were fitted to this engine early this spring as an experiment, and I have been very well pleased with the result. The Norton engine is always a very cool-running one, and Harcourts, to my mind, render it the equivalent of a water-cooled engine. The most noticeable feature was the liquid state of the oil on the cylinder wall, piston, and rings, and on the valve stems. On taking out such a normally hot-working item as an exhaust valve I always found the stem covered with a film of oil (and graphite from the Oildag). Apparently the radiators keep the cylinder temperature low enough

**Some Fads and Fancies.—**

for the oil to remain liquid: to my mind a very desirable state of affairs in an internal combustion engine.

I mentioned Oildag. I have great faith in this "nostrum" ("Ixion" again), and I use it consistently. I have found it particularly valuable in the lubrication of valve stems and guides, and on the inlet valve stem it also helps to prevent air leaks.

**The Simplicity of the 3½ h.p.**

All these three machines have been of the same type, and have been used as general utility machines. Medical practice, holiday runs, and a little competition work have all been mixed up. As machines go, their simplicity nearly equals that of the average two-stroke one meets, and the 3½ h.p. single needs the minimum of attention. My machines have been indulged with various fads and fancies at different times, of which the foregoing two examples, Harcourts and Oildag, have been singularly successful.

A single point plug is a *sine qua non* for this type of engine. It ensures an easy start and freedom from overheating and pre-ignition troubles.

Some of your readers may not know that the 2s. 6d. Sphinx plug can be converted into a very fine racing plug. Detach the central electrode A A. Remove the small point B by filing it off. Carefully bend the point of the electrode A A and replace. Adjust the gap between the central electrode and the body of plug, and lock in position by nut C. Then one has a good single-point plug that will stand up to anything.

Capt. A. Lindsay, M.B., the writer of the article "Some Fads and Fancies." Capt. Lindsay rides a Norton, and competed successfully at the All-khaki Brooklands meeting last August.

**Free Lubrication Advisable.**

The type of machine represented by any of these three is, to my mind, the best all-round mount. At one o'clock I can have a flexible, decorous machine for doing my work, and by three o'clock the same afternoon I can be enjoying the sport of an amateur hill-climb with the same machine, minus a few of the fittings that one adds for comfort and luxury.

Running costs are probably as low as any other type of machine on the market.

Petrol runs me at least 100 miles per gallon. Lubricating oil I use rather heavily—one pumpful every three or four miles average running. In addition, I use one half pint of lubricating oil to every gallon of petrol in my tank. Coolie and Price's Huile de Luxe have been very satisfactory.

Summing up all these facts, I pin my faith to the following specification: A 3½ h.p. long stroke high efficiency single engine, Harcourt radiators, semi-automatic two-lever carburetter, single-point plug, h.b.c.

Philipson pulley fitted in a long wheelbase frame: a pronounced rake on the steering head is essential for good steering. Easily detachable wheels, good mudguards, moderate T.T. bars, T.T. footrests, and knee grips complete the machine that conforms to my ideals. I should like to add a tribute to the excellence of Mr. Norton's production. I have not experienced a single mechanical breakage, barring control wires and the belt rim spokes in machine No. 1, and I have never failed to get home under my own power.

A. LINDSAY, M.B.

## Motor Cyclists Controlling Bodies Overseas.

### Some of the Difficulties to be faced in Australia.

**W**E have received a letter from a prominent member of the executive committee of the Auto-Cycle Association of New South Wales, referring to a paragraph which appeared in *The Motor Cycle* of September 2nd last, in which it was stated that Australia had no ruling body to look after the pastime for motor cyclists, as is the case in other Overseas Dominions. He points out that the A.C.A. of New South Wales is the sole governing body of motor cycling, and also mentions that the sport is controlled in Victoria by the Victorian Motor Cycle Club. His letter, however, does not in any way prove that our original paragraph was incorrect, and it is still a fact that there is no governing body of motor cyclists for Australia, each State apparently having its own. It is up to associations like the A.C.A. of New South

Wales, therefore, as well as the Victorian Motor Cycle Club, to see if it is possible to form such a body.

We recognise that such a course is full of difficulties, owing mainly to the huge size of the Australian Continent. Conditions are often totally different in the various States, and Perth, the capital of Western Australia, is roughly as long a journey (for the trip must be made by sea) from Sydney, N.S.W., as we at home are from New York. This is a point English people often overlook in discussing Colonial matters. Then, again, the amount of inter-State jealousy, in particular between Victoria and N.S.W., would prove very troublesome.

We are in receipt of the rules and constitution of the A.C.A. of New South Wales, which seem to be drawn up on a thoroughly sound basis.

## Aluminium Cylinders.

An Interesting Method of Constructing  
a Very Light Engine.

**A**N engine having aluminium cylinders has been invented and protected by Mr. G. Funck, of Coventry, the object being to produce an extremely light engine having high cooling efficiency, and capable of being produced at a low cost in large quantities. This is attained by introducing an aluminium alloy cylinder without any liner, and in order to reduce the wear of the cylinder walls, due to the scraping action of the usual piston rings, it is proposed to put special contractile rings in the cylinder walls and make the piston in the form of a light steel shell of such a length that it never uncovers the rings. (Fig. 1.) As the piston usually gets much hotter than the walls, and as the coefficient of expansion of the materials used is just in inverse proportion to the heat they have to sustain, it will be seen that the greater clearance necessary for the ordinary aluminium piston in steel or cast iron cylinders is not required.

### Contractile Rings.

These contractile rings in the cylinder walls are claimed to have the following advantage. Instead of keeping the split of the rings slightly open, they will be manufactured so that they just make a perfect sliding fit on the piston when the split of the rings is closed, and will thus make a perfectly tight packing. Any further wear is impossible, and the friction is reduced to the minimum. It is also proposed to fit

The Funck design for an air-cooled aluminium cylinder having two contractile rings in its barrel. The piston is of thin steel and without any rings whatever. The valves are carried in detachable cages of cast iron.

aluminium alloy pistons in connection with these particular rings, as no scraping of the rings is to be feared.

Another proposition is to use in water-cooled engines a plain aluminium cylinder without rings. The piston in this case would be provided with grooves to act on the principle of the labyrinth packing as used extensively on steam turbines. (Fig. 2.)

As the heat conductivity of the aluminium alloy is, roughly, three times that of cast iron or steel, the aluminium cylinders should be specially suitable for air-cooled engines with the radiating fins cast on the cylinder, and if necessary machined all over.

After considering the following facts it will be seen there is no fear of these cylinders cracking. The expansion of the aluminium is, roughly, three times that of cast iron, but the heat conductivity as well is, roughly, three times that of cast iron; as a natural consequence, there is no greater danger of local heat pockets causing the cylinder to crack than with cast iron cylinders, as the material strength is about the same in both cases.

The valves in either case would be suitably arranged in special pockets and let into the cylinders, as is often the practice with existing cylinders. As to the wearing qualities, there is nothing abnormal to be feared. The aluminium pistons now in use with the steel or cast iron cylinders show very good wearing qualities.

An adaptation of the labyrinth packing used in steam turbines, a series of grooves being turned on the outside of a light steel piston, which is carried in a water-cooled aluminium cylinder barrel.

Unless there is more heavy rain before this issue of *The Motor Cycle* appears, the roads which have been temporarily rendered impassable by the rain and wind storm of last week will be free, but care may still be required on the following roads: Exeter-Honiton road, Windsor Road, and Chertsey Lane. Also the Brighton-Lewes road has given way owing to floods.

**I**N giving extracts from a few of the many letters we regularly receive from our Overseas readers, it will be noticed that, even after the exhaustive tests and trials which motor cycles have undergone during the past few years, they require not a few alterations even now to come up to the ideals of many of the harder riders situated in some of the out of the way parts of the world. Such items as spring frames, stronger wheels, larger tyres, greater tool bag accommodation, etc., are a few of the things hinted at.

There is little doubt but that British motor cycles are at the present moment still quite the most generally used machines in the Overseas Dominions. This is undoubtedly due to the superior finish and lasting qualities always associated with British products, but it does not take a person of any great perception to notice in even the few extracts quoted here that a hindrance to the more rapid extension of British products is the casual way in which many British manufacturers transact their business in these far-off parts of the Empire. It would appear that the American manufacturers with their tempting prices, and also their depots with all facilities for the rapid supply of spares, are beginning to attract the attention of even some of the most patriotic riders.

Do we see in these opinions the commencement of a waning of the popularity of British-made motor cycles in the Overseas Dominions? We hope not.

In writing from Natal, South Africa, Mr. E. A. BEHRENS advocates "spring frames, high ground clearance, stronger rims, and greater tool-bag accommodation. Machines should be sold ready for the road, with all accessories.

#### **Wanted, Cheap, Light Machines.**

Mr. W. J. THOMPSON, of Sydney, Australia: "I should say there would be a good opening for a cheap solo machine, one that would sell at about £55 or £60 out here. What is wanted, in my opinion, is one of about 3 h.p. with chain drive, and not too heavy."

#### **The Ideal Machine suggested by a Reader in Portland, N.S.W.**

"At present I use a 1913 4 h.p. single, three-speed, belt-driven sidecar combination. This district is very hilly, and I often pine for more power, so as to be able to streak up the hills without changing gear so often. Belt drive I find very unsatisfactory, except on good roads and in fine weather. In sand, mud, and when crossing water splashes one longs for a chain-driver. Good clearance is very necessary. I measured a well-known make of machine recently, and the gear box was just 3½ in. from the ground, this being the only defect in an otherwise excellent mount. My ideal is a 6 or 8 h.p. twin, three-speed chain-driven machine, side-by-side valves, magneto placed high up behind the engine, and at least 6 in. ground clearance. Wheels should be detachable and interchangeable. Saddle and footrests should be sprung in unison, as I prefer the semi-rigid fixing to the ordinary spring frame for sidecar work. Less mudguarding is preferable—without valances to prevent mud, etc., collecting. The weight should not exceed 250 lb."

#### **The Price of Replacements.**

MR. T. S. WATSON, of Dudley, N.S. Wales: "I use my 3 h.p. Enfield constantly in my work, and find it invaluable. My chief grumble is the price charged for English motor cycles, parts, and accessories compared with American. Why is it, if the American manufacturers can sell their machines and parts at a reasonable price, that we cannot get English goods on like terms?"

#### **Unsuitable Mudguards.**

MR. D. S. JACK, a New Zealand reader, says: "The fittings for attachment of mudguards require to be much stronger. As a rule, after a few weeks' riding on a new machine, these fittings become very loose and noisy. A stout plate fitted on the under side of the guard overcomes this by distributing the stresses produced by the road shocks. Guards, as a rule, are not wide enough: Both front and back should be at least 4 in. wide. The front guard should have side shields at the bottom only, and these well spread, as on these loose surfaced roads, stones, etc., are liable to be picked up, and, if the guard is too close to the wheel, cannot get out, and jam the wheel."

#### **Undersized Tyres and Unsuitable Forks.**

MR. E. A. MACDONALD, Adelaide, after complaining of the difficulty of obtaining parts and accessories, and the prices charged for them, also the vexatious delays over repairs, etc., goes on to say: "I will not say that the finish of the English engine is lacking, neither is the efficiency questionable, but there are numbers of points which must be attended to if they desire to retain the lead on this market. Why will they slavishly stick to 26 in. x 2½ in. tyres? For this country we want nothing smaller than 28 in. x 3 in. I had a famous English machine, the general finish of which was a work of art, but the two points which spoiled it for use out here were the small tyres and the most unsatisfactory type of spring fork. The spring was continually breaking, so in the end, to avoid trouble, it became necessary to substitute a rubber buffer and a strap. There are numbers of this make to be seen here with the fork fixed rigid, and yet the makers still continue to supply this fork."

#### **A Carryable-sized Wife.**

"G.T.B." of Sydney: "It is a very big mistake for any machine to be sent out here unless it is fitted with a variable gear. There is no doubt that those who have the money out here are the working people, and, moreover, if the English manufacturers would see their way to put a machine on the market at a reasonable figure they would do a very large trade here. In England an ordinary working man cannot afford to run a motor cycle; out here he could, but the original cost is too great. Many fitters out here will not accept a job under £5 per week. It is chiefly the single men who go in for motor cycling, but there are exceptions. I took good care to go in for a carryable-sized wife! The English manufacturers seem afraid of the easy payment system, and so lose a great deal of the trade which goes to the foreigners, who encourage easy payments. Nearly everyone buys what he wants, and, in many cases, more than he wants, in this manner."

#### **Machines chiefly used for Business.**

"W.H.M." of Henty, New South Wales: "In my district there are few machines used solely for pleasure, owing greatly to the price charged out here, the majority being used simply for business. Petrol costs £1 for a case of eight gallons, while oil is 6s. per gallon."

### "The Motor Cycle" in the Desert.

From an African reader (Pietermaritzburg): "I lately returned from nine months' Active Service in German South-West Africa, and during the time I was there I received *The Motor Cycle* regularly. It was very much appreciated, and in great demand among motor cyclists, so that even in the midst of the desert we were well posted with the latest in the motor cycle world. Even a picture of a motor cycle was refreshing after months of plodding through the sand on horseback. It is almost impossible to get a new machine of a good make here since the war, and the prices demanded for those it is possible to get are outrageous. For a machine costing £75 before the war £90 is now demanded."

### Wanted, a Substantial Machine.

MR. G. HOBBS, Christchurch, New Zealand: "My idea of a machine suitable for Colonial riders would be as follows: 6-8 h.p. twin, very strong frame, sprung fore and aft, stronger wheels and spokes than usual, at least three speeds, countershaft gear, 5in. tyres. Everything should be as strong and plain as possible, and, above all, very little plating; finished grey or khaki. There are about 8,000 motor cycles in and around Christchurch. Most riders own sidecars, but very few use them continually. The motor cycle races held on the beach at New Brighton, about five miles from the town, attract very large crowds."

### Troublesome Licence Regulations.

MR. R. J. YOUNG, of Sydney, Australia, says: "I have had three machines since being out here, and all were purchased second-hand at home, and after being ridden six months I have always been able to sell them here at a profit. My first—a Rudge-Multi, which is sold here for £84 new—I sold for £70. To obtain a driving licence, or even to have it renewed, it is necessary to apply personally at the Traffic Office in Sydney with your machine, always in working hours between 11 a.m. and 3 p.m."

Recently I lost my number plate, which is white enamel with black figures, size 9in. x 4in. I wrote to the Traffic Department, enclosing 2s., the cost of a new one, and asking for it to be sent in time for use at the week-end. I received a reply telling me I must take my machine in and have it inspected and re-registered. I was unable to get in during the week, and as I specially wanted to use the machine over the week-end I cut a piece of tin the same size, painted it white, and put the number on in black, exactly the same as on my lost plate; but it was of no use, I was fined 11s. 6d. and my licence endorsed, although my old number plate had been found and handed in at the Traffic Office, where it had been all the time."

### Danger of American Competition.

MR. HAROLD D. YATES, of Sydney, N.S.W., writes: "Prices of machines here are, I consider, too high, Triumphs, Ridges, etc., costing anything from £70 to £80 and upwards, according to fittings. The American motor car is almost obtaining a monopoly of this market, and I fear that the American motor cycle will in this crisis go a long way towards the same objective. The Indian and American Excelsior are seen in increasing numbers. The Americans are now turning out some very fine cars and cycles at moderate prices. Personally, I should prefer that we should obtain them from within the Empire if possible."

### Insufficient Clearance.

MR. R. J. WOODCROFT, of Bunyan P.O., Coomar Line, N.S.W., writes: "With regard to retail prices here there seems to me to be an enormous profit made on the motor cycles sold in New South Wales. For instance, I am riding a 3½ h.p. Abingdon 1908 T.T. model, and am told that this machine costs about £50 in England. Out here it costs £78. A drawback to the use out here of a great many of the machines advertised in *The Motor Cycle* is the very low road clearance, which often causes trouble in the country districts. The footboards are also too low."

SCENE IN A MILITARY MOTOR CYCLE HOSPITAL.

With such a vast number of machines in service under most gruelling conditions, there is always plenty of work for the army of mechanics stationed at the different A.S.C. repair bases at home and abroad.

## ANOTHER AMERICAN ARRIVAL.

Emblem 7 h.p. Single-cylinder and 10 h.p. Twin-cylinder Models.

**A** NEW comer to this country from the United States is the 7 h.p. Emblem motor bicycle, which is one of the largest single-cylinders on the road, the bore and stroke being  $89 \times 101$  mm. = 628 c.c. It is handled by the Emblem Motor Cycle Co., 895, Fulham Road, S.W. The engine is conspicuous for the size of its flywheels, which are well designed and constructed so that

The 7 h.p. single-cylinder Emblem. Note the typically American loop frame.

cover is circular in shape, and is screwed on to the aluminium; a large nut being cut in the centre and forming part and parcel of the cover, renders its removal a simple matter.

The magneto, which is the well-known C.A.V. Ruthardt, is carried in front of the engine, and is driven by means of gearing. The exterior of the crank case is well finished, and as it has but few projections there should be no difficulty about keeping it clean. The lubrication is effected by means of a gravity drip feed from the rear of the tank, while extra oil can be given by a pump.

The carburettor is the popular Schebler, which is controlled by means of the right twist handle, the left twist handle serving to actuate the multiple-disc clutch. At the present moment the ignition advance is controlled by a lever situated at the side of the tank, but in future models we understand the spark will be controlled from the handle-bar. A separate exhaust lever is fitted on the right-hand side of the handle-bars.

The frame is constructed of triangularly reinforced tubes of great strength. The top tube is dropped at the rear, and the head has been specially strengthened.

Quite an attractive feature is the luggage carrier, the major portion of which is constructed of U section channel steel, the grid portion being formed of steel rods passed through the carrier frame, while the stand is of similar material and specially substantial.

Both front and rear mudguards are provided with side valances. The transmission throughout is by chain, the front chain being fitted with a cover. All the Emblems in England at the present time

Power unit of the 10 h.p. twin Emblem, showing drive by chain to countershaft

the principal weight is on the periphery, all unnecessary metal being cut away from the space between the periphery and the centre. The connecting rod is a steel forging fitted with a special "non-grain" bronze bearing at the big end.

As is commonly found on American motor cycles, the inlet valve is of the overhead type. A conspicuous feature is the cover of the timing gear case. This

Valve side of the big 10 h.p. twin-cylinder Emblem, the latest American arrival The cylinder dimensions are  $89 \times 101$  mm. = 1,256 c.c.

Valve side of the power unit of the single-cylinder 7 h.p. Emblem.

are single-gear clutch models, but the next batch will be provided with three-speed gear boxes in the usual countershaft position. The spring forks are well designed, the coil springs being entirely enclosed, and grease cups provided to the principal moving parts.

All models can be had fitted with the Remy electric lighting system.

# O.K. Lightweight Motor Cycles.

(Left) Ladies' model O.K. Junior, showing arrangement of dress-shields and mudguards. (Right) The standard 2½ h.p. O.K. four-stroke lightweight. A countershaft drive and a two-speed gear are adopted on both the machines illustrated.

**T**HE O.K. lightweights for this year will consist of four models. O.K. Junior, Mark IV., is fitted with a four-stroke engine, having a bore and stroke of 70 × 76 mm. (292 c.c.), side-by-side valves, and adjustable tappets. The bearings are of large dimensions, cast under pressure from a phosphor-bronze alloy, and the valves are turned from the solid bar. A two-speed gear is fitted, having a gate change and the gears always in mesh; the lubrication of the gear box is by means of a large lubricator, which feeds through a hollow stud in the top of the gear box. The transmission is by chain to the gear box, thence by belt (¾ in.).

The frame is constructed throughout of carbon steel tubes, having a one-piece

head with hardened steel ball races and a bed for the gear box cast in one piece, giving absolute rigidity and easy adjustment; the wheelbase is 51 in. and the height of saddle from the ground 30 in. The tank has a capacity of one gallon of petrol and one quart of oil, large fillers standing well

Gate change on the two-speed O.K., showing gear lever in neutral position

above the tank, and a Best and Lloyd automatic drip-feed lubricator. The handle-bars can be semi-racing or roadster. Other fittings include Amac carburetter, E.I.C. magneto, controlled by lever on the tank, Druid pattern forks, Clincher de luxe tyres, 26 × 2 in., aluminium footplates, and ample mudguards.

The rear foot brake is so placed that it can be operated by the toe without lifting the heel from the footplate—a desirable feature—and the machine is nicely finished in black enamel with a dark olive-green tank. The weight is about 135 lb., and the price £38.

Mark V. is in many respects similar to the model just described; it is, however, fitted with a two-stroke engine, in which, we are assured, great attention has been paid to balance—a matter in

and Moseley tyres, 26 × 2 in., are standard.

Mark VI. has a 250 c.c. engine (64 × 77 mm.), which is guaranteed to give at least 2½ h.p. on the brake.

Mark III. is the lady's model. The engine is rated at 2 h.p., the bore and stroke being 58 × 72 mm. (190 c.c.) The piston has two rings; the flywheels are heavy and well balanced. Large bearing surfaces of best quality are employed throughout. The bolting down nuts are so placed as to facilitate the removal of the cylinder, and the inlet valve is placed overhead. The frame is constructed to give the greatest possible dress clearance, the upper tube being but little higher than is the case in a lady's pedal cycle. The two-speed gear box and other fittings are similar to those already described under Mark IV. The front brake is controlled by Bowden wire, the rear brake by the foot. This machine, like all the O.K. models, is fitted with improved oil-retaining hubs protected by dust and mudproof caps. A handle-bar-controlled cork clutch can be fitted to the lady's model at an extra cost of £2 15s.

Car type foot brake—a standard fitting on the O.K. models fitted with aluminium up-turned footboards.

which many little two-strokes are somewhat at fault. The bore and stroke are 70 mm. (269 c.c.), and the Dixie magneto is coupled directly to the engine-shaft. Lubrication is by petrol,

The two-stroke O.K.—an entirely new model lightweight from the O.K. works.

## The New Ariel Sidecar.

The new model Ariel sidecar. The chassis view shows arrangement of the four supporting tubes to give ample clearance for the rider of the bicycle. The new design of footboard, to which is attached the mudguard, will be observed from the view of the complete sidecar.

**T**HE latest design sidecar to be placed on the market is a new Ariel, for which Components, Ltd., of Bournbrook, are responsible.

The chassis differs very greatly from that used during the past year, as the side tubes are curved upwards to meet the axle, thereby allowing the main frame to be much lower than it was. Also, the attachment tubes are four in number instead of three. As usual, there is one clip on the chain stay of the motor bicycle, and some four inches in front of the rear hub, which clip also is secured to the sidecar axle through a telescopic joint for adjustment. There is a curved tube, clipped to a lug on the axle, running parallel to the axle and then curving upwards to be attached to the seat pillar adjusting pin by a quick-action catch similar to the one used last year. From the forward cross-member there is another tube carried to the down tube of the motor bicycle and secured

by the same type of catch, while the fourth tube branches from the frame side tube to a lug on the tank tube, which lug has a seating in which the cone end of the attachment tube is held by means of a large hexagon nut.

All the attachment tubes are adjustable, and it is necessary only to undo two nuts and also to release two pins in order to remove the sidecar from the motor cycle.

### The Springing.

There are two long springs running parallel with the sides of the frame, and, curving up as a Cee at each end, from which the body is slung. On the rear spring there are small shackles connected to a flat strip of metal passing through the body, while the forward Cee spring end is secured direct to a similar flat strip underneath the nose of the body. Thus, the springing is well carried out and the body rides well without appreciable side sway.

This year a special lamp bracket is fitted at the forward end of the rear spring, instead of utilising one leaf for this purpose as in last year's machine.

The wheel hub is much larger, and there is a neat footboard so placed on the side tube that it acts as the forward mudguard support, the other two supports being strong steel tubes of large diameter and carried in sockets near the hub.

Beneath the seat is a substantial locker. The upholstery is excellently carried out, the general appearance of the body being quite pleasing. The tubular carrier, brazed on previous models to the axle, has been removed, but, if desired, can be fitted as an extra.

### ROYAL RUBY SPEED GEARS.

The Royal Ruby Cycle Co. have decided to adopt the Jardine gear for their 1916 de luxe model motor cycles.

**P. & M.'s ON WAR SERVICE.** These two photographs were taken at the Brooklands aeroplane sheds, and show machines belonging to the Royal Flying Corps. P. and M.'s are used exclusively by this section.

## Two-strokes in Holland.

"Twee takt" is Dutch for two-stroke. Incidentally these handy little machines are growing in favour in the Netherlands.

## A 1916 or 1917 Model?

We saw on the road last week a 4 h.p. single-cylinder Triumph fitted with all chain drive—not enclosed—and a free engine clutch on the engine-shaft, the countershaft gear being retained.

## Belfast and North of Ireland M.C.C.

The result of the Christmas Day novices' trial, held over a circular course in County Down, was as follows: 1, Bryson (B.S.A. sc.); 2, McCluney (3½ Peugeot); 3, Darragh (3 Enfield). Each of the above lost four marks. Other finishers were: Willox (6 Bat sc.), Young (2½ Calthorpe), and Hewitt (6 Enfield

sc.), each losing six marks; Baxter (4 Bradbury sc.) and Robb (4 Quadrant) lost eight marks each.

## Motor Cycles in Holland.

American motor cycle manufacturers are striving their utmost to capture trade in Holland, where, prior to the war, British machines were the most popular. In the absence of British supplies, mainly due to the European conflict, most of the American makers have appointed Dutch agents and sent over supplies of machines.

## Motor Cyclists and Machine Guns.

Many a motor cyclist has during the war period had the intricacies of a Vickers machine gun revealed to him, and to a man possessed of mechanical tendencies nothing is more fascinating in its working than a death-dealing machine gun. A new recruit usually goes through several stages during his training. At the first lecture his interest is aroused by the marvellous capabilities and intricacies of the gun; next time he is told a good deal more, and becomes overawed at the prospect of having to tackle it blindfolded; at the third stage he begins to doubt whether it is not too much of a box of tricks for him, but later sets his teeth and determines to master the gun.

Gradually getting more interested the recruit finally catches machine gun fever, talks about it all day long, dreams about it at night, and when on leave never tires giving little lectures to his parents and friends about the most successful gun of the war.

## Average Prices.

We give below the average prices of second-hand models offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model the average for the past week is quoted. If there were not at least two advertisements, then the last occasion on which they were quoted is given. Owing to the Christmas holidays intervening, the number of averages obtainable for last week only amounts to seven.

Make.	Year.	H.P.	Average for last week.	Latest average obtainable

## LATEST ADDITION TO THE RANKS OF TRICK MOTOR CYCLISTS.

A P. & M. sidecar outfit used by the sea lions of Petite Nina at the Liverpool Olympia. The machine, under its own power, runs round and round the circus, while the two sea lions steer it, sound the horn, and balance things on their noses.

**An Oil-cooled Cycle Car.**

An advertisement reads: Humberettes for sale, one oil-cooled £60, one water-cooled £95. Was it intentional or a compositor's intelligent diagnosis?

**Petrol "Up."**

Another penny a gallon on petrol is unpleasant news. So far as we know, the makers of the Redline are the only firm not increasing the price. From tests made of the Redline spirit it has been shown that it gives the unusual combination of absence of knock and easy starting.

**Lighting-up Times.**

The new lighting regulations, which were reviewed in our issues of December 9th and 23rd, come into operation on the 10th inst.; when lighting-up time will be half an hour after sunset, instead of an hour as heretofore.

**Motor Cyclist Recruits**

Enquiries from motor cyclist recruits have increased during the past week, no doubt in view of the calling up of "groups," but there are no vacancies at present. Indeed, as we announced last week, the War Office will shortly issue new instructions respecting recruiting. In the near future the editor expects to be able to accept a good number of motor cyclists, but applications should not be sent until an appeal is published in our Recruiting Section, when certain particulars will be required.

On Monday last the number of applications personally dealt with by the editor of this journal, Mr. Geoffrey Smith, who is inspecting officer for the South Midland divisional area, totalled 6,110.

**Romance of the War.**

Extract from a Sunday newspaper:

"The engagement was announced yesterday of Miss Margaret Elinor Kingsborough, the only lady despatch rider in the British Army, her fiancé being Dr. Cody, assistant surgeon, Indian Medical Service. Miss Kingsborough is the only daughter of the Rev. Thos. Kingsborough, rector of Kildalton, County Armagh. When the Ulster Volunteer Force was being organised Miss Kingsborough, who is an accomplished motor cyclist, offered her services, and, being accepted, performed several daring feats throughout Ireland and across the Channel."

**Growth of American Exports.**

As showing the rapid growth of the United States motor cycle export trade, it is worth while comparing the export figures for last September with those of September, 1914. In the latter month the total number of machines exported was 118, whereas last September it was 1,683. It is fairly safe to assume that this great increase is in the main due to the inroads American manufacturers are making in the British Overseas Dominions and Colonies.

**Mentioned in Despatches.**

Major A. E. Holbrook, A.S.C., who was recently mentioned in despatches, is a very ardent motor cyclist, and was at one time a very keen rider of a Zenith. Before the war and in the early days thereof he did valuable work for his country in selecting machines for the W.D. His brother is Commander Holbrook of submarine fame.

Captain H. Blackburne, R.F.C., also recently mentioned in despatches, gave his name to the Blackburne motor bicycle, and was one of the founders of the firm of Burney and Blackburne.

**SIDECARS  
AND  
ACCESSORIES.**

In "The Motor Cycle" of January 27th a feature will be made of the latest sidecar attachments and motor cycle accessories.

**Home on Leave.**

Lieut. Maurice G. W. Burton, A.S.C., who before the war was secretary of the Cambridge University M.C.C., and one of the joint organisers of the last Inter-Varsity race meeting at Brooklands, is home on leave in England undergoing a slight operation. We wish him a speedy recovery.

**The National War Funds.**

At the week-end the principal war funds stood as follow:

The Prince of Wales's National Relief Fund (£2,793,000 distributed)	£5,668,098	0	0
The Times Fund for the Sick and Wounded	3,070,303	0	0
The Weekly Dispatch Tobacco Fund	96,003	0	0
The Queen's Work for Women Fund	167,566	7	9

**Lorry Drivers with Fur-lined Coats**

Scene at a site where old houses are being hastily pulled down to make room for extensions to an important munition factory. Several motor lorries are driven up by A.S.C. men dressed in fur-lined and collared coats, who calmly produce cigarette cases and smoke and chat while the workers load the lorries with debris—bricks, planks, and what not. Engines are not stopped—why should they be? Big motors are a fag to swing on cold days, and petrol costs nothing—in the Army!

**Brass Mudguards**

A reader in Singapore has placed an order for a horizontal-engined A.B.C. motor bicycle, specifying mudguards made of brass, the reason being that the roads in that part of the world are watered with salt water, which corrodes all other metals.

**Motor Cyclists as Combatants**

We are informed that certain motor cyclist despatch rider sections are being dismounted and the men put into the infantry. The men concerned were greatly surprised on receiving these orders. It is obvious from this announcement that there has been no shortage of despatch riders for some months past.

**American Manufacturers and German Trade.**

An American Consul in a German provincial town suggests that the German motor manufacturers will not be able to meet the home demand for cars and motor cycles after the war. As practically all usable vehicles have been confiscated by the Imperial Government, and makes of the Entente Allies will not be purchased, there will be an opening for American machines.

**Lord Montagu's Escape**

Though not actually a motor cyclist himself Lord Montagu of Beaulieu, who luckily escaped from the Persia disaster, has been a very good friend to the whole motoring movement, motor cycling included. In the early stages of the industry, when all motorists had an exceedingly hard uphill fight, Lord Montagu nobly upheld their cause in Parliament, when he was the Hon. John Scott Montagu. In his paper *The Car*, which he edited for so many years, he from time to time fostered the motor cycle movement, and devoted a portion of the journal to motor cycle matters. He is a practical engineer, and served his time in a locomotive works.

A group of Triumph testers with their armlets. In the foreground will be noted Lloyd, Cheshire, and Shemans—three well-known names in the competition world before the war—now engaged on the testing of Government motor cycles.

## British Machines' Successes in Australian Trials.

**W**HATEVER may be the percentage of American machines to British in Victoria, Australia, there is no getting away from the fact that in open competition the British machine is hard to beat. In these days, when we are hearing such a lot about American trade competition for our Overseas business, it is good to learn that in an open one-day trial, held on October 23rd by the Victoria Motor Cycling Club, British machines took premier honours.

The course was from Melbourne to Marysville and return, this route including climbing the Black Spur Mountains. A bad storm made the trial very trying

for both riders and machines, and in one part, we are told, the road was under water for a distance of five miles.

Competitors were divided into three classes, and the results were as follow:

### SIDECAR CLASS.

1. T. G. Rogers (6 A.J.S. sc.)
2. S. Jenkins (6 J.A.P. sc.)
3. H. J. Garnham (6 Ariel sc.)

### SOLOS UNDER 600 C.C.

1. E. Tyler (Triumph).
2. H. Godfrey (Precision).
3. J. Booth (Indian).

### SOLOS OVER 600 C.C.

1. B. Finley (Excelsior).
2. W. J. Ousley (Indian).

The best performance of the day was made by Rogers on the A.J.S. outfit, as, in addition to winning his class, he also

secured the special prize for the best showing irrespective of class. He only lost three marks, caused by a puncture, and the fact that this was his first appearance in competition work makes his performance all the more noteworthy.

### Road Race in Western Australia.

British machines also secured premier honours in a Western Australian competition. This was a 150 miles road race—out and home—from Perth, the capital. Results:

1. L. Perry (3½ Rudge), 3h. 52m. 50s
2. H. V. Norton (2½ Sunbeam).
3. C. J. Lewis (7 Indian), 3h. 18m. 31s.

Lewis made fastest time, his average speed being 45.25 m.p.h.

## Canoelet Sidecar Chassis Still Stronger.

**T**HE latest model of the Canoelet sidecar, manufactured by Mead and Deakin, is little altered, but small as the alteration is it indicates that the firm is still pursuing its experimental work in spite of the difficulties of labour and of obtaining raw material. The nature of the alteration proves that much study has been given to the stress diagrams of the sidecar frame.

As will be seen in the sketch, a new supporting tube A running from the axle to the bolt holding the seat pillar has been embodied in the frame. It has a telescopic joint for adjustment. At the axle end is a jaw joint, while another tube runs from the rear cross-member, which holds the spring shackles, to the split lug securing the telescopic joint. Thus the pull on the sidecar is taken down these two tubes as well as on the two front attachment tubes and the

Rear view showing new supporting tube.

adjustable clip securing one end of the axle to the chain stays of the machine. Also the chassis is stiffened considerably, while being supported at five different points.

For the rest, the frame is unaltered, nor has the body been redesigned, the rear springs curving up to meet pins on the two shackles which can be seen on the rearmost tube of the frame.

### SIDECARS AND ACCESSORIES.

January 27th has been fixed as the date of a special issue of this journal dealing principally with sidecar attachments and motor cycle accessories of all kinds. This issue will be enlarged, and numerous illustrations will be included.

Newly designed accessories should be submitted to the editor without delay, with a view to inclusion in this special issue.

## English Rider's Observations at the New York Show.

**O**WING to there being no show at Olympia, it was with especial interest that I contemplated a visit to the National Motor Cycle, Bicycle, and Accessory Show at Madison Square Garden. This was the first time that the motor cycle show had been held separately from the automobile show, as in previous years it has been customary to hold the motor cycle show at the Grand Central Palace together with the overflow of automobiles from the Garden.

The first thing to strike me on entering was the comparatively small size of the show compared with Olympia, for the galleries were not in use, as the machines and accessories were all accommodated in the area itself.

The new Cleveland lightweight has already been described in *The Motor Cycle*, but a word concerning the method of staging the show model may prove of interest. A complete machine was enamelled pure white throughout, even to saddle, handle-bars, etc., and was then mounted in a large gold frame lined with black velvet. Just inside the frame a row of electric lights ran round the sides and were fitted with reflectors so

that the rays were directed on the motor cycle. I have no hesitation in saying that it was far and away the most attractively got up exhibit in the show.

The Smith motor wheels are, of course, made under licence to the Wall Auto-Wheel Co. It is interesting to note that the price in the States is £12. Speaking of the Smith reminds me of the Dayton motor bicycle (the Davis Sewing Machine Co., Dayton, Ohio), as this machine is in reality an ordinary bicycle with a motor wheel in place of the usual front wheel.

There were several freak machines, if I may so term them, one being the "Auto Ped" (if I remember rightly), a hybrid composed of aeroplane wheels, small air-cooled engine, the frame and steering-pillar very much like a child's "glider," and towards the back of the "chassis" (?) a tiny saddle. The total weight of this contraption would be about 40 lb., and it could easily be lifted with one hand. Another machine of unconventional design was "Le Militaire," the specification of which includes channel chassis, four-cylinder engine, artillery wheels, three-speeds, reverse, small side

wheels raised or lowered by a lever, and which, when on the ground, supports the machine so that one can reverse even when riding solo.

A few weeks before the show there had appeared in the trade papers an announcement to the effect that a new motor cycle would be placed on the market at a very low price; it was, in fact, to be the "Ford" of the motor cycle world. This machine was exhibited at the show under the name of the "Tiger Autobiike," and was of very light weight and fitted with a two-stroke engine, but a close examination did not impress me very favourably.

The accessory exhibits were on the whole rather a poor showing, and the sidecars leave much to be desired in the way of comfort and finish.

Considerable interest was evinced in the motor cycle machine gun and motor cycle ambulance exhibited by the National Guard, and it is interesting to note that motor cycle sections are to be attached to several branches of the American Army.

## MILITARY NOTES.

## Motor Machine Guns in the Official Film. Army and Navy Honours for Motor Cyclists.

## MOTOR MACHINE GUNS PREPARED.

IN the official cinema film, "Britain Prepared," naturally the Motor Machine Gun Service is represented. As a matter of fact, the section of the M.M.G.S. is one of the most attractive, for the sidecars and the motor cyclist scouts flit about here and there, some emitting smoke from the exhaust, which, from a spectacular point of view, adds animation to the scene. (Perhaps we ought not to have known this!) First, the battery is seen to fall in and move off in orderly manner. The battery arrives in open country, a section commander and scouts on motor bicycles leading, the gunners take up their positions, and after several rounds (during which a smoke bomb gives quite a realistic effect), a rapid retirement is effected, the whole of the movements being made with the utmost precision. The smart manner in which the men mount and dismount their guns from the sidecar chassis is perfectly extraordinary. Altogether the film gives a vivid idea of the rapidity and ease with which a sidecar machine gun battery may be concentrated at any given point in the shortest possible space of time. There are stretches of rough going which show what the modern sidecar outfit will withstand if need be, and the sight of the gunners turning round in an extremely narrow space—a point where the sidecar scores over the armoured car—makes a lasting impression.

These films, "Britain Prepared," are to be exhibited in neutral countries, and we advise readers of this journal, wherever they may be, not to lose an opportunity of seeing them. Anybody who may have doubted the efficacy of sidecars in modern warfare will quickly change his views.

A few weeks ago we were privileged to see a private view of the film, which can be recommended as a tonic.

## DESPATCH RIDERS' DIFFICULTIES IN MACEDONIA.

IN the course of a letter, reproduced below, from Sapper C. D. Wallbank, R.E., written from Salonika, one obtains an idea of the difficulties that will have to be encountered by despatch riders when an Allied advance is made. According to our correspondent, the present condition of the roads in the war zone on the Western Front is like a billiard table when compared with the tracks around Salonika. The writer says:

"I have had your paper sent to me every week since the war began, and I can assure you that I anxiously await its arrival, too, as one cannot forget the old sport, no matter where one may be. I have only just left Flanders myself. Whilst there I continually came across H. R. Davies (of Sunbeam fame), "Duggie" Brown (of Rover), Godfrey Boyton (Triumph), and Lovegrove (Scott), all in the same section. The paper goes the rounds after I have finished with it, and I should think it must go through at least a hundred hands in no time. We shall be jolly

glad when this business is all over, and I shall then return to the favourite 'pastime keener than ever.

"I do not know how any motor cycle will fare out here; there are no roads, only mule tracks covered with huge boulders, etc. It is simply terrible. As regards mud, one can easily imagine this, seeing that it is all hills and mountains and continually raining hard, and the water streams all over the mule tracks. The poor D.R.'s will be tried more than ever now. I have been all over Flanders, Belgium, and France, and I can truthfully say that there is not a road there that would in any way compete with these around Salonika. We could have some wonderful hill-climbs here, but whose work has been am afraid the high referred to in "Military speed merchants Notes." He was recently would come to grief. home in Cardiff on I should never come leave.

pete again if I thought the English roads and hills had turned out like these; one would want a new machine after every competition.

"I should like you to warn all D.R.'s coming out here to bring plenty of rainproof kit. Any readers who have oilskins and sou'-westers to dispose of could not do better than send them out here."

Lance-Corporal A. B. Wade, of the M.M.G.S.,

Sergt. E. J. Bass, R.F.A., a leading light of the Essex M.C. in the pre-war days. He commenced his active service work as an ambulance driver.

## A RED LETTER DAY WITH THE M.M.G.S.

"CHRISTMAS Day at Bisley camp was a day long to be remembered," writes a gunner in the Motor Machine Gun Service. "White tablecloths in the general mess-room (a most unusual thing) were the first things to attract attention. A clean knife, fork, and spoon were waiting for each man, and drinks were provided free. Major Coulson read a letter from their Majesties the King and Queen, and drank a toast to the M.M.G.S. The fare provided included turkeys, geese, chicken, peeled potatoes if you please, with two vegetables, and Christmas pudding. What a time we had! No wonder we spent a jolly good time on Christmas Day.

"It was rather quaint to see men destined for Overseas service walking about the camp in the rain wearing sun helmets."

## ARMY AND NAVY HONOURS.

To BE K.C.B.

COLONEL H. C. L. Holden, assistant director of transport at the War Office. The inventor of the Holden motor bicycle, and Vice-president of the A.C.U.

PROMOTED TO COMMANDER.

Flight-Lieutenant E. V. S. Wilberforce. Well-known competition rider of a Douglas motor bicycle.

PROMOTED TO LIEUTENANT.

Flight Sub-Lieutenant L. P. Openshaw.

MENTIONED IN DESPATCHES.

Captain A. E. Davidson, R.E. Member of the Technical Committee of the R.A.C., officiated many times as judge on the occasion of A.C.U. trials; timekeeper at Brooklands.

Temporary Captain C. M. Smith. Former director of Zenith Motors, Ltd., a keen motor cyclist in his early youth, and a prominent designer in the automobile industry.

Temporary Lieutenant C. Q. Roberts. One of the principals of Messrs. Burney and Blackburne, Ltd., and a well-known competition rider. Killed in action at Festubert.

Captain H. de Haviland. Was formerly with the brothers Burney, and one of the early designers of the Blackburne. Well-known as an aviator.

Brevet-Lieutenant-Colonel A. R. Hildebrand, D.S.O., R.E. An officer who had much to do with the training of motor cycle despatch riders before the war and during the early part thereof.

Temporary Second-Lieutenant C. T. Cadman, motor cycle section.

Temporary Captain C. M. Gamage, London Divisional R.E.

Corporal T. G. Campbell, motor cyclist, No. 30291, Wessex Divisional Signal Co.

Fourteen officers and men in the Motor Machine Gun Service.

Gordon Gibson, a former Triumph competition rider, has joined the A.S.C., M.T., and expects to go abroad shortly.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

### Motor Cycles for Home Service Men.

Sir,—Your correspondent "C.P.O., R.N.V.R.," in the issue of December 23rd, 1915, opens up an interesting question. I trust through your paper it may be possible to hear of opportunities of either getting facilities granted, as he suggests, or even some of your readers or others in trade circles may realise that many of us on Home Service, or with training yet to be completed, have financial status now "below par" compared to "civvy" experiences or conditions.

For myself, I have a permanently damaged right arm and wrist (got in the way of Turk bombs!) and a shrapnel splinter below the knee, which still remains; surgeons consider it dangerous to remove. Push cycling is not possible. My future work will leave time for motor cycling, when the days would pass, as in years gone by, most pleasantly. Arrears of pay need time to get, but if I could hear of some "Christian" with a decent lightweight to part with, in the circumstances I would gladly pay up a price within my reach. Other fellows in the same boat as I would no doubt be grateful if you could thus "help us along."

CORPL., R.E.

### On the Road with a 3½ h.p. Scott Sidecar Outfit.

Sir,—I was much interested in H. Mortimer Batten's article on the Scott, but the reference to the low weight of the flywheel is surely not accurate. The real reason of acceleration, so far as it is governed by the flywheel, is, I consider, the absence of heavy oil round it and because it is large and has a heavy rim. Then as regards his reference to the back tyre, I certainly found mine wear better than on any four-stroke single or twin either, and I consider the gears excellent for long life of tread, both for standing start and also manipulation when moving, as a certain amount of slip takes place on changing.

MAJ. GROUT.

### Varying the Power of Electric Lights.

Sir,—I have noticed several letters in *The Motor Cycle* regarding dimming electric head lamps on motor cycles. The latest, by "W.K.O.M.," would not work unless the head and tail lamps were the same voltage and candle-power, which is seldom the case.

I have fitted to my Indian a very simple device (the sketch explains itself). It is an old two-way switch as used

Method of dimming electric lights described in the accompanying letter from "D.T."

on motor cycles when accumulator ignition was in vogue. The coil is made of about 3in. of 30 gauge M wire, obtainable at any electricians, and wound round a nail to form a coil, more or less being used to suit individual requirements.

This system is not as wasteful as many think. It does not use the same with light dim as with full light. An ammeter in circuit will soon prove this, as the light is dimmed by cutting down the current passed through the lamps.

Trusting this will interest at least Indian riders, D.T.

### The New Lighting Regulations.

Sir,—May I thank you for your note on the light question in your last issue? The notice posted up in our village most distinctly says "all head lights whatever strictly prohibited," which one naturally supposed referred to motor cycles and cycles in general.

A.L.H.

### The Mysterious Sidecar.

Sir,—Your contributor, Dr. A. M. Low, whose article has held my attention and interest, has certainly covered a wide range of engineering science. His statements will not, I trust, come as a shock to other engineers. In such contention, are we to fling aside wisdom obtained through ages of "bridge" engineering, or to infer that the principle of a span or bridge between the wheels of a motor cycle and sidecar is different from that obtaining in other engineering? I do not think such "bridge" can be made flexible in the sense, I gather, he means, the only way of securing it being by orthodox methods and metals, such as spring wheels or the frame constructed of spring steel. The axles of Mr. Henry Ford's car are rigid axles, the designer having taken care that the general lack of rigidity does not apply to his axles, which spans or bridges cannot in any sense be termed "springs." I think that it is rather "in the clouds" (no pun) to labour the aeroplane suggestions. The designer of sidecars is not dealing with occasional landing shock, but with continuous impact and load. Wood chassis! (Am I to take it Dr. Low means them to be without metal flitch or other reinforcement?) *horrible dictu*. Springy wood chassis and with a general lack of rigidity, cost not to exceed thirty shillings! Dr. Low would no doubt provide us also with "the mysterious human monstrosity" to drive it over an A.C.U. course, and may I, like Gilpin's observer, be there to see.

BERTRAM G. SMITH.

Sir,—Respecting the contribution by Dr. Low that appeared in your issue of December 30th, I beg to differ very widely from your contributor's ideas as to the construction, springing, and utility of the modern sidecar.

Whilst I have no intention of impugning the feasibility of Dr. Low's ideas pertaining to the construction of sidecars, I strongly resent the modern sidecar being criticised in such sweeping statements, most of which cannot be substantiated.

Your contributor has apparently lost sight of the excellent lightweight sidecars that have been designed to give maximum comfort with the minimum of weight, and, furthermore, can be detached or attached in a few minutes, and, speaking from experience, are perfectly devoid of the trouble and disadvantages stated by him.

I have convincing proof that "a rigid chassis as strong as one which is slightly flexible" does not mean doubling the weight, provided the design is such that the weight is distributed to the proper quarter.

In referring to "the average sidecar being sprung no better than a farmer's cart," your contributor (a learned man, I admit) gives proof that he has either never ridden in a farmer's cart or in a modern sidecar that has been built by a reputable firm.

This is not destructive criticism but common sense.

LEONARD B. HENDERSON.

(Designer Henderson Sidecars.)

**Duplex Lubrication.**

Sir,—I read with interest, as I always do, the article by "Ixion" published on Dec. 9th. I should like to suggest that "Ixion" for once has been caught napping, and that his oil consumption is more in the neighbourhood of 14 fluid ounces than 44 fluid ounces per 100 miles (a quart). My own two-stroke is always slightly over-oiled with a petrol mixture which works out at about the above consumption of oil, and I may say that the bearings on this engine are, in an expert's opinion, still quite sound after practically daily use for eighteen months. I think if "Ixion" will carefully measure the oil delivered by his drip-feed pump he will find it to be very little indeed over  $\frac{1}{2}$  fluid ounce instead of two ounces, thus making his consumption much the same as my own.

I had occasion to handle a  $3\frac{1}{2}$  h.p. J.A.P. engine the other day, fitted with a drip-feed, and the owner and myself were much worried with lubrication until we measured the pump ( $\frac{1}{2}$  oz. only) and gave a charge every  $2\frac{1}{2}$  miles. The result was quite satisfactory and did not over-lubricate.

In conclusion, I should like to say that, after experience for several years of various types of machines, I have not yet met anything to beat the two-stroke with petrol lubrication for general handiness at speeds up to 33-35 m.p.h. and average speeds of 23-25 m.p.h. in ordinary country. In September last I ran from Newbury to Bournemouth, Bournemouth to Weston-super-Mare via Shaftesbury and Cheddar, Weston to Pontypool via Bristol, Gloucester, and Chepstow, Pontypool to Newbury via Severn Tunnel. The total trouble was a broken magneto chain (known to be weak and spare carried) at Cheddar. Weight carried, myself 10 stone, luggage about 24 lb. Jet, No. 24 Amac. No failures on hills or other trouble barring the chain.

Thirty-three to thirty-five miles per hour is the limit, I consider, for an ordinary 269 c.c. two-stroke in touring trim and with two-speed gear box. Higher speeds may be obtained, but I should very much like to see this question threshed out properly. Only the other day I read an advertisement in which a man claimed to have travelled at 49 m.p.h. on a machine of this type. I consider this likely to deceive buyers who are not expert motor cyclists, and likely to give them quite a wrong impression as to the capabilities of the machines, which will go practically anywhere in their own time, but not at 40 m.p.h. W. S. PULLEN.

**A Clever Sidecar Conversion.**

Sir,—A friend of mine was the proud (?) possessor of an out-of-date wicker sidecar, which was not underslung, and recently I set to work, in my spare time, to modernise it at comparatively little expense. The photographs show the result achieved.

The frame is ash covered with three-ply wood. The seat back is loose and gives access to the back portion, which is for spares, etc. There is ample leg room. The new body is lighter than the old basket one. The chassis was not altered in any way, the bearer bars fitting the new body with the addition of 5in. links at the back to bring the body level.

Owing to it being low and tapered at the front and back, the combination will take hills on top gear that had to be taken before on bottom. Further, it is warmer and more comfortable than the old basket.

After being faced up with lead paint, it had two coats of green and two of varnish, and upholstered in green it looks smart, as well as being warm and comfortable.

FRANK MOAT.

**Two-stroke Lightweights—A Criticism.**

Sir,—The letter from C. Binks, Ltd., in your issue of last week, re two-stroke lightweights, is most interesting, and, alas, as I know to my cost, too true.

I have just purchased a new 1916 model  $2\frac{3}{4}$  h.p. two-stroke two-speed machine, which was spoken of by your contemporary as "noticeable for its . . . remarkably efficient mudguarding." It was partly due to this that I decided on purchasing the machine I have now. I wish I could compel the writer of the above statement to ride this machine for the rest of his life on roads under conditions similar to those of the past week! I rode my machine down from London, about fifty miles, and the state I found it in next morning was heart-rending. It was smothered in mud; and thank goodness I had overalls on! The chain was very gritty, the coil and band brakes so full of grit and wet that the wheels would hardly go round. I thoroughly cleaned the machine and overalls, and started out to a place *only two miles away*, and on arriving there found that the front part of the tank was plastered with mud, so that its colour—of Royal blue—was not recognisable. My boots were not fit to go into any house with, likewise my overalls, which were smothered halfway up my thigh!

When will the manufacturers use some commonsense, and turn out a machine which will keep engine, working parts, and last, but not least, its rider clean under winter conditions? I have ridden one lightweight, and only one, which has got efficient mudguarding, and as I am not a trade rider I may mention its name—the Douglas. I rode one in Devon over much worse roads than the ones round here (Buckinghamshire), and, except to keep myself dry, I did not have to wear overalls. So if one firm can make a machine with efficient mudguards, all makers can, and I think they deserve great censure for their slackness in not paying attention to this most important item of motor cycle construction.

Having always found rim brakes satisfactory, I feel entitled to say that such fierce brakes as coil or band ones are absolutely out of place on lightweight machines.

I had a 1914 6 h.p. combination which had flaps extending on each side of the front mudguards. One night, on my way back from Wendover, I heard a scraping noise. Stopping the machine, I found the right mud flap was hanging by the proverbial thread; I pulled it off. Since then, to my astonishment, I found that my right leg, above the thigh (the boot and leg up to knee were protected by leg shields in front of footboards), kept perfectly clean, whereas the left one always got smothered in bad weather. The 1916 model of this machine has omitted these flaps, and has thoroughly efficient mudguarding.

AN ALL-WEATHER RIDER.

Sidecar conversion referred to by Frank Moat (see letter on this page).

**Wanted, a Motor Tricycle.**

Sir,—I am nearly sixty years of age, and, owing to the war, I find I must resume duty after having retired some years ago. I was for years a cyclist, but now, owing to failing strength, I am compelled to adopt motor assistance, as I have to be on the road in all weathers. I do not want a motor bicycle on account of side-slip; what I want is a motor tricycle, easily managed, which will travel about 15 m.p.h. I think a 2 or 2½ h.p. would do, but the frame must be 22in., as I am short. Can any of your readers recommend such a machine?

—R. AITCHESON.

**Easy Starting.**

Sir,—Allow me to express my thanks to your correspondent Mr. J. Douglas for his letter on this subject in your issue of November 11th.

I ride a 5-6 h.p. Rudge-Multi and sidecar, and have followed out his instructions respecting the Senspray carburetter, and am more than pleased with the result. I have possessed this machine for a couple of years, and ride it throughout the year, wet or fine; and in cold weather it was at times very difficult to start the engine. Since I have made the improvement with the Senspray carburetter I can now start it with one single thrust down of the pedal. I can strongly recommend all riders of Rudge-Multis to adopt Mr. Douglas's idea, and I am confident they will be grateful to him for his suggestion.

J. WRIGHT.

**The Chater-Lea Carrette.**

Sir,—Your article in *The Motor Cycle* of December 23rd in reference to the above has greatly interested me. I have been looking out in your journal for some time for a direct-driven small car such as the above. I have been almost on the point of writing you before to suggest that same idea for small cars. It is, to my mind, the only correct way of driving any vehicle, car, or cycle. To drive at a right-angle, as in the orthodox type of petrol car, is wrong. The former method, I think, must be more productive of m.p.g. If such a car were "perfectly satisfactory" in 1907, why not adopt the same method of drive now? (I do not forget that there are the Seal and the H.S.M.) I do not own either car or motor cycle myself (I wish I did), being but a humble pedal-cyclist, but I would like to see some readers' opinions on the above subject.

H. R. ETCHILLS.

**Wanted—Detail Improvements.**

Sir,—I hope you will give my letter a space in your valuable journal, as I should like to point out where my favourite mount can be improved.

As everyone knows, motor cycle riders are doing wonders in this great life and death struggle. We have a good engine, frame, and wheels, but we want something to keep our legs warm and dry, also to cut off vibration to the spine.

In civil life my work brought me a lot of riding in all weathers, and so I procured a set of weatherproofing accessories made by the Kumfurt Motor Co., of Cookham, Berkshire, and I only wish now that I had brought them out here with me. Their knee grips were a revelation to me, and when used in combination with their hammock footboards were as good as a spring frame without the complications. These footboards, too, besides cutting off vibration from the legs, do just what is necessary to keep the rider's legs warm and dry.

I hope, if you put this letter in your columns, it will be read by those who have the power to alter things, as I think you will agree with me that by altering a few fittings a machine can be turned into the true all-weather-all-road-motor-cycle-car.

H. H. BENFIELD (Sergt. R.E., France).

**The Motor Cycle in the Balkans.**

Sir,—Although I am not in the least known to you, I should just like to write and let you know how really pleased I felt when a long-expected mail which arrived recently brought me three copies of *The Motor Cycle*, and amongst them the annual Buyers' Guide, which is of great interest not only to me but to all the other readers of your valuable paper who have been waited suddenly out of that comparatively home-like country, France, into this outlandish spot! People at home may possibly think that motor cycles are unknown in this expedition, but that is not so at all. Three-speed countershaft Triumphs and 2½ h.p.

Douglases abound, while there are a few other makes to be seen also. Recently I noticed a 4 h.p. Douglas and sidecar doing great work over a ploughed field, but this is the only passenger machine I have seen, and as yet there are no M.M.G.S. with this force. The roads are few and far between, but those that there are are quite passable, though they are gradually being ruined by the never ceasing streams of motor lorries which pass up and down. Many of the camps lie away from the roads, and D.R.'s have to make their way across all sorts of ground to reach them. Recently we had deep snow and twenty-five degrees of frost, and it was no joke riding them as you may imagine. However, in spite of all the difficulties and hardships of this campaign, everyone is very cheery and determined to make the best of it, though most people are wishing they were back in France and able to get occasional leave.

I trust I have not bored you, but I thought you might just like to know how much your paper is appreciated out here, and also that the go-anywhere motor cycle is doing its duty bravely amongst the rocky hills and muddy valleys of Greece and Serbia.

B.A.R.E.

Macedonia.

**Fittings on American Motor Cycles.**

Sir,—I do not wish to enter into any argument as to American motor cycle fittings (I prefer English), but your correspondent, Mr. S. A. Serpell, would make out that fittings on English machines are bad.

Everyone to his own experience. I may say I have a motor cycle (Zenith-Gradua) which has done 15,000 miles, and not once have I had any trouble with the rusting of wires or any other fittings, or with the machine itself.

As regards gears, with the ever-reliable Gradua, high or low gears do not worry me; I can always get the gear suitable to the load and road conditions.

As regards the American firms sending a mechanic if the machine breaks down, why not have a motor cycle which does not break down?

EDWARD COX.

Sir,—I am glad you have taken up the cudgels on behalf of English motor manufacturers and agents in the matter of "service." A very striking instance of their courtesy and thoroughness in this respect came to my notice the other day.

A B.S.A. rider was "hung up" last week, seven miles from Birmingham, through magneto trouble, due to a week's riding in vile weather and flooded roads, and compelled to finish the journey to town by train. At 5.30 in the afternoon he rang up the city agents, and explained his troubles. At 11.15 next morning he called by appointment at their establishment in Broad Street, and was driven by their mechanic in a luxuriously appointed outfit to the scene of the breakdown, and by one o'clock the machine was on the road once more, with a new magneto fitted.

ON DRAFT.

**Cylinder Cooling.**

Sir,—I am enclosing a sketch showing a method of fitting thin copper stamped ribs to cylinders of engines, which was described in my British patent No. 19,969, of 1909, but this method of rib fixing was not claimed, and any of your readers are quite at liberty to use it.

The ribs are made from thin copper stampings, and are slipped on to the cylinder, and held the desired distance apart by any suitable means; the ribs and cylinder are then covered, and fixed together by a coat of electro-deposited copper, as sketch.

The advantage of this method is the close association of the ribs and cylinder with the electro-deposited copper, which gives the most efficient conduction of heat from the cylinder.

I have never tried this method of cooling, but have been informed that it is quite possible to deposit the copper on both cylinder and ribs. If any of your readers should try the experiment I hope they will let their fellow-readers know the result.

FRED UMPLEBY.

# QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

## An Automatic Inlet Valve.

**Q.** I have a motor cycle with an automatic inlet valve. (1.) How far should the inlet valve open? (2.) How strong should the spring be? (3.) How can I find a leakage in the float? I have taken the float out and tried it in petrol, but I cannot find the leak.—G.H.J.

(1.) About  $\frac{3}{16}$  in. (2.) So strong that the valve will just open when you hold it by the seating and jerk it sharply. (3.) The best method is to place the float in boiling water. This will cause the petrol to evaporate, and the bubbles caused by the vapour escaping will indicate the leak. This method also avoids any likelihood of injury to the float.

## Blow-back on a Two-stroke.

**Q.** I have a 1915 two-stroke, Amac carburetter, Dixie magneto, and fixed ignition. It has run 3,500 miles during the summer without a fault, up hill and down. It has a 23 jet, and is doing 100 miles to the gallon. During the last three weeks it has developed blow-back through the carburetter. This occurs whenever the machine has hard work to do. Up a long steady incline it will commence this blowing back, explosions occur at the carburetter, and it emits puffs of smoke. It will often come to a standstill, or else force one to drop down to low gear on an incline or hill that it used simply to roar over. The engine is perfectly clean. I can find no leaks. Plug changed, ignition timing and everything else checked, but no result. Closing the air lever does not cure it, and a new 28 jet makes no difference. I have tried several other carburetter adjustments, but with no improvement.—H.A.W.

The trouble is in all probability owing to pre-ignition, due to a faulty plug (try a new one of good manufacture, and with a single gap and stout electrodes), or excessive carbon deposit would also give this trouble. You should remove the cylinder and make sure that the top piston ring is free in its groove and not stuck with carbon, as is frequently the case with two-strokes. As all the alterations in the carburetter adjustment make no difference, it is unlikely that this is causing the trouble, and you would do well to adjust it as it was before the trouble began. You should also make sure that all the ports are free from carbon deposit, and that there is none in the aperture into which the plug screws.

## Avoiding Sideslip.

**Q.** (1.) I have a 1915 5 h.p. Indian, three-speed gear, which I wish to ride for business purposes during the winter. Are there any means by which skidding can be prevented, as I have to ride over both greasy country roads and also the town roads and tramlines? (2.) Does riding with a sidecar spoil the rider or machine for fast solo riding? (3.) Are the articles advertised for keeping the plated parts from rusting a success, and if so, do these dry on hard, or do they have to be renewed every time the machine is cleaned?—D.C.J.

(1.) It is difficult to find a tyre which is equally suitable for both town and country riding. Probably a combination rubber and steel-studded cover would be the best compromise, but even with this you would have to be careful on tramlines. (2.) The fitting of a sidecar is certainly a solution of the difficulty, and if properly fitted and lined up correctly no damage should result. There is no reason why the machine should not be ridden solo afterwards, and it should have no effect upon the driver so far as solo

riding is concerned. (3.) The varnishes made for preventing plated parts rusting are fairly satisfactory, but, being transparent, care should be taken that all parts are covered. The removal when no longer required is rather a tedious job. These varnishes are fairly permanent, but turn yellow after a time. Smearing vaseline over the bright parts is really quite as satisfactory, but requires renewing every time the machine is cleaned.

## Road Matter in Carbon Deposit.

**Q.** (1.) What percentage of the composition of deposit on the cylinder head and piston of the average motor cycle engine is road matter; and (2) carbonised oil? I am of the opinion that about 50% is road matter.—H.K.B.

The proportion of road matter and carbonised oil which go to form the carbon deposit depends entirely on circumstances. It will vary according to whether the machine is ridden over dusty roads or not, and also the brand of lubricating oil used, and so on. It is quite possible that under certain circumstances the deposit might be found to consist of 50% road matter.

## GOOD SPIRITS ARE EVERYTHING!

Everywhere one goes the khaki-clad Britisher unconsciously supplies the answer to the popular phrase, "Are we downhearted?" It is a good omen! The illustration depicts a battle in the snow, the Douglas team winning.

### Thermo-syphon Cooling.

**?** I would be very much obliged if you would give me an explanation to the following: The radiator fitted to my cycle car is honeycombed in design, the engine is 8 h.p. and water-cooled. There are no pipes running through the radiator, and the water circulation apparently goes down the sides. (1.) By what principle is the water supposed to be kept cool? (2.) Is the honeycombed radiator merely for show, or is it meant to act as an air cooler to the engine?—H.L.E.D.

(1.) Unless there is a water circulation pump fitted the system is thermo-syphon; that is, the heated water in the engine rises while the cool water in the bottom of the radiator sinks and takes its place, and so on, so that a natural circulation of the water is continually taking place. (2.) If the radiator is a proper honeycomb radiator the water percolates through tiny channels in the honeycomb so that the air passing through the openings cools it rapidly.

### Winter Clothing.

**?** Will you be good enough to recommend the most suitable clothing for winter wear when driving a sidecar combination?

For bad weather I use oilskins, but dislike them for fine weather. Would a leather vest with sleeves be as good as anything for the body and arms, or would a suit of chamois underwear be a better investment? I propose trying handle-bar muffs, as I find two pairs of gloves are insufficient to keep my hands warm. Reverting to chamois, would chamois pants be strong enough? For my nether limbs I use thick pants, stockings, flannel trousers, and shooting boots, and yet in cold weather I cannot keep warm. I think one needs more protection for one's extremities. I want to keep warm, but do not want to look unsightly or feel uncomfortable when off the machine. I should be very grateful for your opinion of a good outfit for really cold weather.—E.H.H.

A leather vest with sleeves would be an excellent idea, and would keep you very warm. Wear thick riding breeches, long knitted socks, gaiters, and thick boots, and we think you will keep quite warm. Chamois underclothing is also good, but hardly necessary if you are garbed in the manner suggested. We manage to keep our hands adequately warm by wearing woollen inner gloves and leather Asbestol gloves over these. The type of glove which, although not very convenient, certainly keeps the hands the warmest is that in which the fingers are all in one piece, similar to children's gloves. If using ordinary gloves always have them a very easy fit. Of course, if you use handle-bar muffs you may wear quite thin gloves, as they keep the hands warm. A fleece-lined coat reaching to below the knees would also help matters. See article in *The Motor Cycle* of November 18th, page 486.

Giving the youngsters a treat. A three-speed 1913 model Triumph, belonging to Mr. Budd, of Hastings, with a good load in the sidecar.

### Loss of Power.

**?** My machine is a  $3\frac{1}{2}$  h.p. 1913 model, bought second-hand in August, 1915. For about two months it ran perfectly, taking any hill I came to on top gear by opening out the throttle and slightly retarding the ignition. I use it every day, and till about a month ago I used a leather belt, when I got a new rubber one. Now the engine knocks very soon on going up a hill—sometimes a small rise—and on opening out the throttle would stop if I did not reduce the gear very considerably. It does not gather speed as it ought to do when I open the throttle on top gear, but it does better on low. The cylinder and piston have both been cleaned well, the valves ground in, the ignition is all right, and the carburetter has been thoroughly examined too, all quite recently, but I cannot say there is any improvement. The valve springs, I have been told, are all right, too. Do you think my trouble is due to wear, and, if so, what will be the likeliest part to find wrong?—H.J.M.

It is difficult to say what is wrong with your machine without seeing it, especially from the brief details you give. There are many points that would cause a machine to fall off in power as yours has apparently done. If you look to all the following adjustments, and make sure they are all correct, there should be no reason why the machine should give further trouble. One of the chief causes of knocking and bad pulling is carbon deposit. See that the piston and cylinder head are quite clean, and that

the piston rings are free in their grooves and not bound up with deposit. The clearance between the valves and tappets should not be more than  $\frac{1}{2}$  mm. The carburetter should be adjusted so that you should be able materially to improve the running by opening the air, but when giving full throttle an improvement should be effected by slightly closing it. If you are unable to give any air it points to a stopped up jet; if you are able to give full air at all speeds it shows too large a jet. Weak valve springs will also cause bad running. Make sure the plug is not faulty in any way. The silencer outlet should be quite free, otherwise overheating will take place and cause bad running and knocking. Make certain all bearings both in the engine and bicycle are free and not binding. The most likely causes are carbon deposit, stuck rings, wrong valve tappet clearance, or weak valve springs. The machine would, of course, accelerate better on low than high gear. When you have the cylinder off for cleaning purposes you should make sure that the piston and connecting rod are absolutely true and that the piston is running exactly parallel in the cylinder.

### Oil Leakage.

**?** I have a  $3\frac{1}{2}$  h.p. 1912 motor cycle which recently has developed the bad habit of very freely splashing oil out from between the belt pulley and crank case, and also an appreciable amount of oil is blown out through the belt pulley, which is the air release from the crank case. Can you please tell me the best way to overcome these troubles, as at present I am more or less spotted all over with oil after a very short ride, and the machine is always covered?—S.M.T.

The trouble may be due to the crank case release valve being stopped up and not working properly, or to a worn bearing. Possibly the fitting of a felt washer would help matters. With regard to the hollow crankshaft which acts as a release valve, we can only suggest that you plug up the hole and fit a relief valve with a long pipe fitted to it to the crank case.

### RECOMMENDED ROUTES.

BIRMINGHAM TO BRIMS COMBE.—M.L.W.

Birmingham, Alcester, Evesham, Teddington Cross Hands, Cheltenham, Painswick, Stroud, Brimscombe.

BATH TO SWANSEA.—J.P.P.

Bath, Bristol, Pilning Station, train to Severn Tunnel Junction, Newport, Cardiff, Cowbridge, Bridgend, Pyle, Aberavon, Neath, Morriston, Swansea.

STOKE-ON-TRENT TO EDINBURGH.—R.D.W.

Stoke-on-Trent, Sandbach, Northwich, Warrington, Wigan, Preston, Lancaster, Kendal, Penrith, Carlisle, Ecclefechan, Beattock, Moffat, Crook Inn, Broughton, Romano Bridge, Penicuik, Edinburgh.

**SPECIAL NOTICE.**—Copies of "The Motor Cycle" may only be sent to neutral European countries if posted direct from the offices of the publishers or by newsmen who have obtained permission from the War Office for this purpose. The publishers of "The Motor Cycle" have obtained the necessary permission, and, consequently, can send subscribers' copies as usual. Before sending through newsmen it is important to enquire if permission has been obtained, as otherwise copies intended for neutral European countries will not be forwarded by the Post Office.

# Norton

## Ideal for Present Conditions.

### YOU

cannot do better than select a Norton, whether you require a machine for solo-riding or as a passenger vehicle.

The T.T. Model illustrated has a small engine—only  $3\frac{1}{2}$  h.p. 490 c.c.—(which means Economy) yet it forms an ideal combination if used with our light model sidecar.

Remember also this machine holds the sidecar record for Brooklands Hill, the 50 miles Championship of Ireland, and many other honours.

## The Food Drink which promotes fitness and efficiency is

# HORLICK'S MALTED MILK

A glass of Horlick's is always the best invigorator. Taken before a ride it will give strength and endurance, and after strenuous exertion there is no better pick-me-up. At all times it gives and maintains fitness and stamina, and is especially useful to men on Active Service.

**SUPERIOR TO TEA, COFFEE, COCOA, AND BEEF EXTRACTS.**

READY IN A MOMENT WITH HOT OR COLD WATER ONLY. NO COOKING.

**Served in Hotels, Cafés, and Railway Refreshment Rooms**

Also available as delicious food tablets to be dissolved in the mouth. Relieve hunger and thirst and prevent fatigue.

Supplied in Sterilised Glass Bottles, at 1/6, 2/6, 11/-, by all Chemists and Stores  
The Tablets also in convenient Pocket Flasks at 6d. and 1/- each.

Liberal sample sent post free for 3d. in stamps.

**HORLICK'S MALTED MILK COMPANY, SLOUGH, BUCKS.**

In answering these advertisements it is desirable to mention "The Motor Cycle."

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd., and crossed**

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pay carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## MOTOR CYCLES FOR SALE.

### A.B.C.

**FOR A.B.C.** and all makes motor cycles, write Morgan and Maxwell, the London Motor Mart, 80, High Rd., Streatham. 150 motor cycles in stock. Lists free. State requirements. [0748]

### A.J.S.

**A.J.S.**, 1916, 2½ h.p., £58.—Turpins, 22 and 29, Preston Rd., Brighton. [0716]

**1916 A.J.S.**, 4 h.p., in stock, £76; Millford sidecar to suit, £14.—Cross, Agent, Rotherham. [X8270]

**A.J.S.** Combination, early 1914, 3-speed, kick-start, perfect; £55, or exchange.—16, Longmead Rd., Tooting, S.W. [8175]

**A.J.S.**—1916 models actually in stock at P. J. Evans, John Bright St., Birmingham. 6 h.p. and 4 h.p. solo and combinations, also 2½ h.p. lightweight models. [8121]

**1915 6 h.p. A.J.S.** Combination, absolutely in stock, this luxurious outfit complete only costs £102/10; exchanges, easy terms.—Julian, Broad St., Reading. 'Phone: 1024. [X1485]

**6 h.p. A.J.S.**, 1914, 3-speed countershaft gear and free engine fitted with Gloria sidecar, fitted with Lucas lighting set, Lucas horn, rear light, tools, and spares; any severe trial given; mechanically sound, as new; 70 gns.; rare opportunity.—Wauchope's, 9, Shoe Lane, London. [X8232]

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

## MOTOR CYCLES FOR SALE.

### A.J.S.

**1915 2½ h.p. A.J.S.**, 3-speed, all chain drive (enclosed), excellent condition, 2 lamps, 2 generators, tools, etc.; £47, or near offer; seen by appointment.—Barrett, 142, Denmark Hill, S.E. [X7541]

### Alldays.

**ALLDAYS** Matchless, 1914, 2-stroke, perfect condition; £18.—Hilder, Reginald Rd., Bexhill. [8149]

**1915 Allon**, 2 speeds, lamps, horn, speedometer, nearly new; £35.—1, Pilgrim Hill, West Norwood. [8083]

**NEW Allons**, 2-speed models £42, single-speed models £34; delivery from stock; cash or extended payments.—Wauchope's, 9, Shoe Lane, London. [X8233]

**ALLON**, 1915, 2½ h.p., 2-stroke, fitted new crankshaft, flywheel, connecting rod bearings at a cost of £5, and completely overhauled, in fine condition; £27, or offers; must sell.—S.J., 56, The Grove, Ealing. [8030]

### Ariel.

**ARIEL** 5-6 h.p. Combination; £93/10; actually in stock; generous deferred payments.—Lamb's, 151, High St., Walthamstow, and 50, High Rd., Wood Green. [8183]

### Arno.

**SMART** Arno Combination, 1914, 3½ h.p., 3-speed, cane sidecar, well upholstered, lamp, horn, Spray; 38 gns.—Railway Garage, Staines. [8228]

### Auto-Wheels.

**AUTO-WHEEL**, with or without lady's 3-speed Raleigh, all in first-class condition; £15, complete.—W. Vaisey, 61, Leeming St., Mansfield. [X8194]

# Levis

—the master  
Two-stroke

## Watch The "Levis"

THE "LEVIS" set the fashion in Two-strokes. It was the first successful air-cooled Two-stroke motor cycle put on the market. It has had hosts of imitators, but it still maintains its lead in every respect.

### Why ?

The first "Levis" built was the outcome of our own knowledge, experience, and experiment. We imitated none — we originated. We produced a new type of motor cycle and speedily proved its worth. The history of the "LEVIS" is a story of remarkable and continuous success.

And it is not our policy to stand still. We are leaders — not followers. We have introduced many innovations, and we have more to come. These will be announced when circumstances permit, and meanwhile our advice to all riders or intending riders of Two-strokes is "Watch the 'LEVIS.'"

Particulars of our improved 1916 models will be sent on request.

## Quite a Boom

in motor cycles for business purposes — and in Melbourne, as elsewhere, the reliable Royal Enfield is invariably the chosen machine.

There never has been a motor cycle to equal the Royal Enfield for consistent reliability. Over Scottish roads where no sidecar combination had penetrated before, climbing the precipitous slopes of Table Mountain, carrying letters in far-off New Zealand, and with the British, Belgian, French, and Russian Armies in the sternest spheres of war, Royal Enfield motor cycles have always "made good."

✦ BEAUTY ✦  
that is more than skin deep  
The fact that a  
HERCULES  
SIDECAR

commands universal admiration wherever it is seen by reason of its beautiful finish and pleasing outline is, after all, only the least of the many reasons why so many decide in favour of a Hercules against all other sidecars. For the beauty of the Hercules is more than skin deep. The beautiful workmanship throughout — the flawless material employed — and the final touch that means so much to every detail of construction and finish — all contribute to the beauty of the Hercules. And the Hercules simply bristles with useful exclusive features not found on any other sidecar. You should send for the art catalogue — it tells you all about "the sidecar the ladies love." The Hercules Cycle & Motor Co., Ltd., Conyere Street, Birmingham.

# Mr J.B.

"An honest plain-dealing fellow"

As surely as the John Bull Tyres are just as good, just as honest, so also is the

## JOHN BULL DEEP-DRIVE BELT.

We believe this to be the most efficient, the most lavishly-made rubber and canvas power-transmitter it is possible to buy, and—riders say it is!

With the John Bull you get 13% to 33% extra driving surface—you have a belt which, because of the unique construction and position of the core, ensures great flexibility—a belt in which the outer rubber is specially suited to the work of power-transmitting, and so tough that its gripping qualities are quite exceptional.

To-day you are studying economy; then specify the John Bull—"the belt with the longer life."

# In the Service of the King

## HONOUR.

TWENTY-FIVE PER CENT. of the skilled workmen employed in the manufacture of "SPHINX" Plugs are serving in the Fighting Line with wounds and honour. Those who remain behind are serving with equal honour in the daily supply of thousands of "SPHINX" Plugs required by His Majesty's Forces. BECAUSE there is no other firm in the British Empire who for over ten years have made the manufacture of sparking plugs their sole speciality, THEREFORE is their plant, their experience, their organisation, and expert knowledge required in the Service of the King.

Sole London Agents for "IXION" Motor Cycles.

**WM. WHITELEY, LTD.,**  
QUEEN'S ROAD, LONDON, W.

## SIZE AND EFFICIENCY

**T**HE manufacturers of the P. & M. have not succumbed to the temptation to increase the cylinder capacity.

They came to the conclusion that 500 c.c. was sufficient for a single-cylinder machine.

The result is that the P. & M. is just as satisfactory for solo or sidecar work as larger single-cylinder machines — and infinitely more economical.

For example, 100 miles per gallon of petrol is not uncommon on the latest P. & M. models, and 90 miles per gallon can be obtained without special tuning-up or effort.

**7/6** Allowance Guaranteed for old tyre towards nearly all new motor cycle covers.—Particulars to Taylors', Tyre Stockists, Store St., London, W.C. [0626]

# The IVY Two Stroke

## Programme for 1916

The IVY—during the year 1915 has maintained its splendid reputation, and we are assured by letters from our clients that the little machines are giving every satisfaction. We take this opportunity of thanking those past and present riders of the IVY Two-stroke, whose kind patronage has enabled us to put before the public the aristocrat of its type, and to assure potential purchasers that for 1916, although only improved in detail, it is better than ever.

We are retaining all the models which have been such a success last season, viz.:—Tourist, De Luxe, and Lady's two-strokes, with or without 2-speed gears, and are introducing one new model—a 3 h.p. two-stroke (70 x 90) single-cylinder, which will be sold as a solo machine, and with a sidecar as a lightweight combination. This latter, however, will not be ready for delivery before February, 1916.

**Tourist Model** Fixed engine **£29 10**  
2 1/2 h.p. (64x70)  
Solo Machine. 2-speed **£36 0**

**De Luxe Model** Fixed engine **£34 0**  
2 1/2 h.p. (64x70)  
Solo Machine. 2-speed **£40 10**

**Lady's Model** Fixed engine **£31 0**  
2 1/2 h.p. (64x70)  
Solo Machine. 2-speed **£37 10**

**3 h.p.** single-cylinder two-stroke, 70 x 90 bore and stroke. Solo machine, and with sidecar as combination, with or without 2-speed gear. Prices not yet fixed; deliveries cannot be commenced before February, 1916.

# A NEW YEAR AND A NEW PLUG

1916

Pro.  
Patent.

## FORWARD TYPE M

The outer insulator is permanently welded to steel body by patent enamel, making an absolutely and permanently gastight joint. Within this outer insulator is fixed a second insulator composed of mica. Should the outer insulator, therefore, get accidentally cracked or broken, the spark would not be affected in the least.

# OUR WEEK-BY-WEEK TALKS ON BELT DRIVE

JAN.  
6.

AT THIS PERIOD of the year you may perhaps be troubled by belt slip. Belt slip, of course, is really only a manifestation of the fact that belt drive is the right form of transmission for a motor cycle. The power of the engine being temporarily greater than the driving wheel can convert into forward movement, owing to the holding nature of the road surface, the normal cushioning of the drive, which protects the whole machine from transmission shocks, develops into belt slip. To avoid this, retard the ignition slightly, and do not open the throttle suddenly. It will be found helpful, too, to fit a

## STANLEY "SPARE LINK"

which grips the engine pulley all the way round.

Fits any hook fastener. Costs 1/-

If there is anything you wish to know about belt drive, WATCH THIS SPACE, or write us direct. Our experience is at your service.

Send a postcard for two interesting booklets.

## STANLEY MOTOR BELT AND FASTENER CO.

## GOOD WORK

—the best obtainable—  
and the best materials go  
to the making of Beldam  
Retreads—same workman-  
ship and materials as Beldam  
Tyres. That is why they  
last so long—often longer  
than the first covering—why  
they are such a good invest-  
ment. Send old covers—any  
make—and we will quote  
cost of repairs or retreading.

Write also for price list of Beldam Tyres.

The Beldam Tyre Co., Ltd.,  
Brentford, Middlesex.

## TRANSPARENT NUMBER PLATES

(WOOD'S PATENT.)  
**A LONG FELT WANT SUPPLIED.**  
The law says that it is necessary to clearly show identification marks and registration numbers, otherwise you are liable to a fine.

The advantages of Wood's patent transparent Number Plates are as follows: They comply with the law, are always clear and legible, never require repainting, cannot possibly get out of order or broken as there is no glass in the construction. Are fitted with a Ruby rear sign. Sent ready for fitting, which can be done in a few seconds. Price for fitting to any existing lamps complete, 7/6. Price as above, with Electric Bulb and Holder complete, 10/6.

Plates complete will be sent by return on receipt of registration numbers accompanied with postal order.  
**W. O. WOOD, Millgate, Market Place, STOCKPORT.**

## PETROL and OIL TANKS

We specialise in highest grade tanks of every description, best workmanship and material, satisfaction guaranteed.

Every tank tested under pressure before leaving our works. **PRICE, FROM 15/-.** Ask for booklet, post free. Trade Enquiries Specially Invited.

**A. GREEN & Co.,** 56-60, Chapel Street, Salford, MANCHESTER.

## SIMPLEX

AND

# STANDARD BELT FASTENERS

**PLEASE ALL BECAUSE  
THEY SATISFY ALL.**

Absolutely unbeatable both for moderate cost and satisfactory service. Perfect for good design, reliable material, and excellent manufacture. Never break, pull through, nor become accidentally detached. Give most phenomenal long wear, in many cases exceeding 10,000 miles.

**THEIR EASY BELT ADJUSTMENT  
IN TWO MINUTES OR LESS IS  
ALMOST MARVELLOUS.**

**MERELY CHANGE  
THE CONNECTING  
HOOK FOR ONE  
OF DIFFERENT  
SIZE, AND HEY  
PRESTO, THERE  
YOU ARE. !!!**

**SIMPLEX  
6d.**

**SIMPLEX  
ADJUSTABLE  
9d.**

**STANDARD  
10d.**

**STANDARD  
ADJUSTABLE  
1/-**

### Four-cylinder Motor Cycles.

**I**T is no new prediction of ours that the four-cylinder engine may yet come into general use on motor cycles. Any motor cyclist who is lucky enough to be intimately acquainted with the best which has yet been produced in four-cylinder cars cannot but be impressed by their controllability, their smooth and gliding motion, and must at some time have longed for a tiny four-cylinder motor cycle engine. Of course, we have had four-cylinder motor cycles for something like ten years past, but only in very small numbers. The original ones, which possessed automatic inlet valves, were by no means easy to keep in proper running order, but later specimens, embodying a more positive mechanically operated valve, have proved a decided improvement. Again, an extra cylinder in early days spelt so much more trouble, but this is not necessarily the case nowadays, with the rapid strides made in the longevity of all working parts, particularly in the case of the valves.

The growing popularity of the high-powered sidecar outfit directs our thoughts to the four-cylinder engine. With a miniature four-cylinder engine the friction losses are too great to make it a success; but in considering a capacity of approximately 1,000 c.c., an even-turning four-cylinder can be made a real success, if not a revelation, in smooth and quiet running. A four-cylinder engine would, as a matter of fact, overcome several shortcomings of the modern sidecar outfit. Primarily we have the comfort of the driver to consider. He is not in every case insulated from road shocks by a spring frame, and discomfort is a factor likely to increase rather than decrease in view of the abnormally heavy military traffic which is cutting up our roads. Therefore he would welcome a perfectly balanced engine and a vibrationless machine to help him out.

Another point lies in the difficulty, serious so far as a novice is concerned, in con-

trolling the speed of a small single or twin-cylinder engine when in the free position, either for changing gear or in traffic. A well-designed four-cylinder engine is wonderfully docile in this respect, and will turn over comfortably and quietly at a quite extraordinarily low rate of revolution.

Again, when once warm, no engine is easier to start than a four-cylinder. A movement of a kick starter over not much more than a quarter of a circle will set such an engine in motion, provided, of course, it is in reasonable adjustment. Carburation is simplified, and an automatic instrument is ideal. Against these advantages we have to consider the increased cost of manufacture; but it is probable that after the war cars and motor cycles will be assembled from parts, not made in oddments as in the past. Production in quantities will be the regular order. Thus, with improved manufacturing methods, there is a possibility that a four-cylinder engine properly designed would exceed by very little the cost of a V type engine built in small numbers. After all, a buyer would not grumble at a little increase, in view of the extra attractions. While writing the foregoing notes we had in mind the high-powered passenger outfit. At present we do not think the four-cylinder engine is called for in any numbers on motor bicycles on account of its weight and length, which necessitate a heavy and comparatively unwieldy solo mount. Later years, however, may well modify our views, for with aluminium pistons and aluminium cylinders in the air, and a consequent appreciable reduction in the weight of the power unit, there are all sorts of encouraging possibilities.

Having expressed the editorial view on the subject, we direct our readers' notice to an article in this issue on four-cylinder machines, written by "Ixion," than whom probably no motor cyclist has had more practical experience on the road with machines of every type and horse-power.

# Pros and Cons of the Four-cylinder.

By "IXION."

**E**XPLAIN the fact as we may, there is a persistent and increasing demand for the costlier and more luxurious types of motor bicycle, despite the formidable competition of cycle cars and light cars, and the improved speed, comfort, and climbing powers of the simpler and cheaper two-wheelers. This fact, coupled with a prolonged road trial of the American four-cylinder Henderson machine, has led me to wonder whether the next few years may not conceivably establish the four-cylinder motor bicycle as the standard machine *de luxe*, especially for sidecar work. The arguments on either side may be tabulated as follow.

## In Favour of the Four-cylinder.

(1.) Complete absence of engine vibration at all speeds on top gear, and at all speeds up to half throttle on the lower gears.

(2.) Absolute smoothness of drive with the rigid transmissions, the even torque of the engine enabling the drive to dispense with spring sprockets and cushion hubs.

(3.) Ease of starting. A modern machine must be startable from the saddle; under this limitation, a big twin calls for perceptible physical effort and a long stroke of the starting lever, even when every detail is in perfect order; the four-cylinder will start from warm with a movement of about 45° on the lever or pedal, and demands much less effort, as the compression to be overcome is reduced by 50%.

(4.) Elimination of gear changing. A four-cylinder resembles a steam engine in its flexibility, and can be driven at speeds ranging from 6 to 60 m.p.h. by the operation of a single lever, *i.e.*, the throttle; automatic carburettors, giving satisfactory results with four-cylinder engines, exist in great numbers. A three-speed gear is unnecessary; and the emergency ratio of the two-speed gear box will seldom be requisitioned.

(5.) Steadiness on grease. One would think that the long, heavy four-cylinder would take some holding up on bad surfaces; my experience points in the opposite direction, for the pull on the back wheel is so smooth and steady that the machine is as easy to hold up as a 100 lb. belt-driven baby two-stroke.

(6.) Continuous engine noise. It is common knowledge that the public taste will have nothing to do with two-cylinder car engines, however well balanced, because the irregularity of the exhaust sound is deemed objectionable. Whatever weight this factor may possess applies equally to motor cycles, especially at low speeds, when the single goes "put-put-put," the twin "putput, putput, putput," and the four "b-r-r-r." As Mr. S. F. Edge used to say, the "silence" for which the motoring public clamour is in practice a *continuous* noise!

## Some Drawbacks.

There are, on the other hand, obvious drawbacks to the four-cylinder principle being adopted on two-wheelers, though some of them are of a temporary character, and are ascribable rather to the facts that the idea has never been worked out with enthusiasm by all our designers, and that not one rider in two hundred has personally tested its merits, than to inherent and irremediable defects.

(1.) *Difficulty of Cleaning.*—The engine outlines are complex, and the surfaces bristle with innumerable interstices, which cannot be kept clean. (Probably inseparable from air-cooling; but water-cooling is quite practicable, and, in conjunction with an encased magneto and carburetter, could afford a smoother surface than any existing motor cycle engine.)

(2.) *Greater Complexity.*—The motor cyclist is generally something of an ignoramus, mechanically speaking, and the multiplication of such parts as valves and sparking plugs will hamper him, besides causing more frequent stoppages. (This is to be contested. The bearings, valves, sparking plugs, etc., of four-cylinder light car engines give less trouble than the corresponding details of a single or twin-cylinder motor cycle engine, and are more durable; these light car engines have been rapidly evolved in response to a sudden demand; four-cylinder motor cycle engines might well evince a similar superiority. On the second point, the tracing of troubles is easier on a four-cylinder engine than on a twin, chiefly because the engine will always start and run on three cylinders, whereas a twin will not always start and run on one cylinder; or if it does, its running is so bad that the tester does not like to keep it working until he has solved the difficulty.)

(3.) *Greater Inaccessibility.*—This criticism is entirely untrue. There is no reason why the parts of a four-cylinder engine should not be quite as accessible as those of a two-cylinder.

(4.) *Awkwardness of Decarbonisation.*—This cuts both ways. The four-cylinder Henderson engine is mounted above a tubular platform brazed into the frame, and the engine can be slid bodily out sideways for decarbonisation far more easily than the ordinary big twin engine can be dropped out downwards. If sufficient care be taken in keeping the control rods of the gear, clutch, etc., out of the way, the four-cylinder engine should be detached with more ease than the twin, since its freedom from vibration permits it to be mounted less rigidly, therefore it need not be built so substantially into the machine. When dismantled, it is probably slightly the more difficult of the two types to decarbonise; but as it lends itself better to scientific lubrication and to water-cooling, its perfected forms should require less frequent decarbonisations than the twins.

(5.) *Ultra-long Wheelbase.*—The designer of a four-cylinder machine must choose between mounting his variable gear in the back hub, or elongating his wheelbase to a degree which spoils the machine for solo work. Hub gears are rapidly passing out of favour, but no practised rider likes the tremendous wheelbase which results if a gear box is accommodated inside a frame behind a four-cylinder engine. This defect is negligible when a sidecar is added, for the wheelbase of a sidecar outfit may be lengthened without any disadvantages.

I should advise designers who are interested in the future of the costly high-powered motor bicycle to make a very thoughtful trial of the four-cylinder F.N. or the Henderson.

### "Mechorns" for Sidecars.

I apologise for the above atrocity—please puzzle it out; I print it as a horrid warning against American abbreviations, and to introduce the advice of a sidecar owner who does a lot of his mileage in very heavy traffic. He has fitted his mechanical hooter to the sidecar tube, and sounds it with his foot, thus leaving both hands free for other duties. I wonder how many of the mechanical hooters on the market are strong enough to withstand the thrust of my No. 10 boot, especially when I am in a petulant mood (or "peevied," as the Americans would say). Anyhow, I personally conceived the same brilliant notion, but when I examined the slender shaft of the plunger of my own hooter, the angle of its stem, and the watch-like fragility of the mechanism inside the casing, I decided it had best remain hand-operated.

### A Tale without a Moral.

Second Lieutenant Buggins got thrown off his gee on a very, very 'ard, 'igh 'road. Moreover, the men laughed. Moreover, just as he had nearly cut out First Lieutenant Wuggins with the very pretty barmaid at the Fox and Hounds in the neighbouring town of Sloshton, Wuggins, in most unsportsmanlike and ungentlemanly fashion, refused to contribute to his own discomfiture by taking Buggins into Sloshton on his big "Met." six evenings a week. On the seventh evening, Buggins, being junior sub, was usually orderly officer. So Buggins hied him to town, and bought a motor bicycle, on which to beat all records into Sloshton, and (delirious dream) to joy-ride Miss Jenkins pillionwise. Buggins showed off his new purchase round the camp. One of the D.R.'s, requested to pick holes, remarked that the silencer extension would get some crumpled if "sir" had a left-hand side-slip. The next D.R. respectfully ventured the remark that the machine was as silent as a Rolls-Royce, at which Buggins swelled visibly, until the D.R. explained that, by reason of the aforesaid silence, "sir" would probably run over somebody before the week was out. Chief artificer is consequently ordered to remove the extension pipe. He does so. After mess Buggins starts for Sloshton, his engine emitting a veritable Brooklands crackle. *En route* Buggins overtakes the C.O. riding a blood mare. Blood mare objects to Buggins's crackle, and throws C.O.; C.O. conceives a prejudice against Buggins. Buggins is presently transferred to the third line, as result of said prejudice. First line goes to France, and is concerned in a bayonet charge against uncut wire and concealed machine guns. All officers of Buggins's company wiped out. Buggins is safe at Sloshton, wooing Miss Jenkins nightly, in absence of Wuggins on active service. Strange but true; Buggins's life was saved by a badly designed silencer extension pipe. This tale has no moral; it is merely a study in causation.

### Flooding Carburetters with Two-strokes.

Can anybody tell me why most new carburetters are delivered with leaky needle valves nowadays? As most of my recent purchases have been two-strokes, I was almost driven to the conclusion that testers adjust for a slight flood to get easy starting, relying on the engine suction to stop the overflow when the machine is hard at work. But the other day I took over a new four-stroke, and found the usual flooding in progress, so I began an overhaul. Both the tank taps were leaking; the drain tap was easily stopped by hammering the plug barrel into its socket, screwing the nut tightly up, and inserting a packing washer of light tin. The petrol feed pipe tap was incurable, as I wished to leave it in a rotatable condition, and no amount of grinding would render it petrol-tight. Luckily my box of bits contained a spare tap, which was soon substituted. Then I started on the carburetter. Luckily this had no bobweights, so that I could remove it from the machine and test the fit of the needle valve on the bench. It is always a delicate business to grind in a float needle. My own plan takes the form of making a tin lid for the float chamber, and drilling a central hole just wide enough for the tip of the needle to emerge; even this does not ensure absolutely central grinding. I suppose the trouble is that most of our best mechanics are on active service or engaged upon munitions.

### One of the Mighty Fallen.

The other day I ran across A. E. Catt, hero of a winter six days record ride, and found him gleefully bestraddling a two-speeded baby two-stroke. He had bought it in a fit of pique, consequent upon brief ownership of a Yankee single-cylinder. Forsaking British goods reluctantly, owing to war scarcities, he fell in with one of those hopeful but muddy-brained concessionaires, who expect to make money by supplying Englishmen with Yankee single-cylinders. I have a great respect for some Yankee twins I could name, but I gang very warily where Yankee singles are concerned. Your Yankee manufacturer does not really care a couple of splitpins for single cylinders; I am not quite sure why he makes them; they are of no service in a business which is wrapped up with speed records, and I can only suppose that even in America there are a few riders who can't afford the 7 h.p., and anyhow, he meditates, the British market is stupid enough to prefer singles on the whole. So he takes a circular saw, bisects his twin, and calls it a single, with the result that you have to take two days off if you want to decarbonise. It has never dawned on the average Detroitter's brain that, though you cannot easily make the cylinders of a 7-9 h.p. quickly detachable, it is a sinful 4 h.p. which needs its engine dismounting from the frame for a carbon scrape. After a dose of this sort A. E. Catt invested in a British two-stroke, and when I saw him he was off on a long business trip.

# A Variable Jet Senspray Carburetter.

How to Make and Use an Attachment which Varies the Jet from the Handle-bar.

**C**ARBURETTER experimenting, or tuning as it is popularly called, is always an interesting subject with motor cyclists, principally on account of the possible increase in economy or power, whichever may be the end in view, but also because no other part of the machine's equipment is so sensitive to slight variations, and the dividing line between improvement and deterioration is so finely marked.

That a Senspray carburetter is a powerful instrument will not be denied, but as it could not approach in the matter of economy and slow running one or two other makes previously tried, the writer was prompted to try what experimenting could do in this direction. The slow-running feature, of course, demanded a pilot jet, and the handy by-pass made by Badcock's settled this question after a few initial adjustments, but the petrol consumption remained practically unaffected. It was now possible to run at five miles per hour on top gear with passenger in the sidecar without any signs of snatching or irregular pulling on the part of the engine, and with the clutch out all signs of racing had disappeared. The consumption trouble was a harder nut to crack, and it took several hours' thought before a needle-controlled jet solved the difficulty. It was evident from consumption tests at various speeds that more petrol was wasted proportionately at low road speeds than at high speeds, but if a solution were attempted by the use of an exceedingly small jet, then at half throttle the engine would take practically no air, and its hill-climbing powers were reduced. In other words, economy was obtained at the sacrifice of power. From this it soon became evident the jet must be variable to suit the road conditions, and the rest of the time was spent in devising how it could be done.

Details have already appeared in this paper of a needle-controlled Senspray carburetter, but they lack the main essential feature, in that to be of any real service the normal position must be the position of maximum economy which demands the instant variation of the jet while driving to meet sudden emergencies, and any such adjustment must of necessity be controlled from the handle-bar. The actual fitting up of the various parts requires a certain amount of skill and care, but is not beyond the scope of a keen amateur able to use a few simple tools.

## How to make the Attachment.

The principal operation is drilling the holes in the carburetter and spray tube exactly opposite the centre line of the jet, and it is better to spend some time in rigging up an attachment or clamp for the part to be drilled and some support and guide for the drill, as any deviation from the true position will be detrimental, and might easily result in permanent damage to the carburetter.

In this hole is soldered a guide tube, consisting of a piece of brass tube about  $\frac{5}{16}$  in. outside diameter and of 18 gauge metal, carrying at the top a round brass nut tapped  $\frac{1}{4}$  in. Whitworth for the upper portion of its length, the lower portion having been drilled out to slip over the brass tube and sweated in place.

The sliding portion which works inside the tube consists of a short piece of  $\frac{3}{16}$  in. diameter brass rod having an ordinary fine sewing needle soldered into a hole in one end and the inner strands of the Bowden cable into a similar hole in the other end. Above the rod and threaded on the wire is a steel spring, the outside diameter of which must not exceed  $\frac{3}{16}$  in., and having sufficient strength to overcome the friction of the Bowden cable, and a brass regulating screw, the head being counter bored to act as a stop for the outer member of the cable, and a  $\frac{1}{16}$  in. hole drilled right through the screw for the inner member. The

threads must be turned or filed off the lower end of the screw to permit it to enter the guide tube a short distance below the level of the tapping. If any difficulty is experienced in threading the  $\frac{3}{16}$  in. rod through the quarter nut a drill slightly over  $\frac{3}{16}$  in. in diameter can be run down the nut which will cut away the sharp edges of the thread without materially affecting its hold on the screw.

The handle-bar control is made from a second piece of brass tube about

$\frac{1}{4}$  in. only outside diameter, and a length of screwed brass wire of the size known as 4 B.A. A clip for the tube is first made from sheet brass or copper and soldered in place, the end being drilled to fit under the hexagon set screw on the Senspray control. The tube has soldered on one end a brass block drilled right through for the Bowden inner wire and counter-bored for a short distance up as a stop for the outer covering. The screwed brass wire is drilled at one end to take the inner strands, and the other end fitted with a large milled nut for adjusting the lift of the needle and a smaller round nut which is afterwards soldered to the screw to form a head.

Before soldering the Bowden wire and small nut in position assemble the carburetter parts on the needle

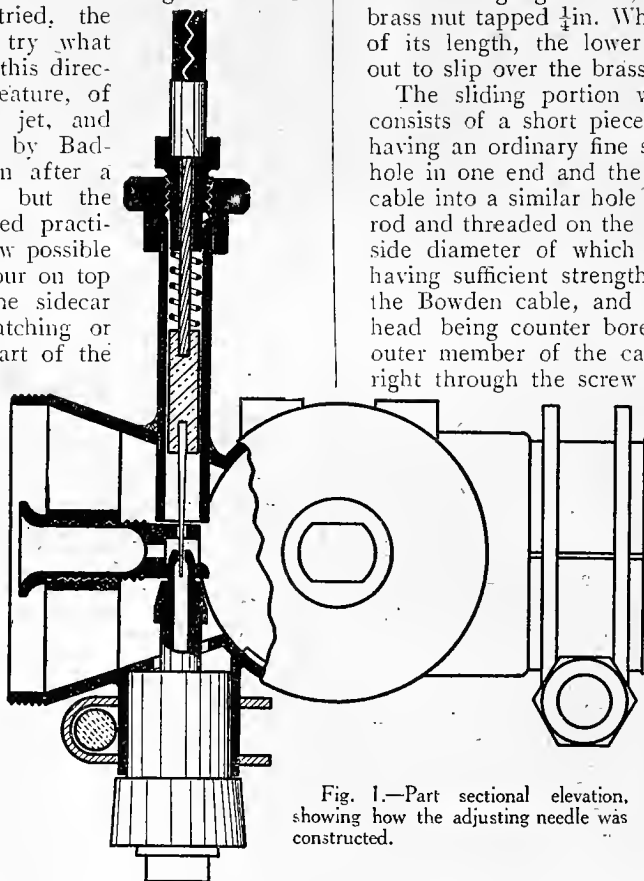

Fig. 1.—Part sectional elevation, showing how the adjusting needle was constructed.

**A Variable Jet Senspray Carburetter.—**

end of the Bowden inner strands in the order previously mentioned.

**The Method of Adjustment.**

To adjust the parts insert the needle into the carburetter guide tube and screw down the regulating screw as far as it will go, and by looking through the carburetter ascertain the position of the needle in the jet. The exact distance it descends into the jet depends on the size of the jet and the diameter and taper of the needle, but it should

not be so far down that the jet is completely stopped up; probably  $\frac{1}{2}$  in. from the top of the jet will be the maximum.

Still keeping the needle in this position, place the large milled nut on the handle-bar control and screw up until the needle is just on the point of lifting; then screw on the small round nut into contact with the milled nut, and solder the small nut only to the brass screw. Cut off any projecting screw and file smooth. It will now be evident the needle is at its lowest position when the two handle-bar nuts are in contact, and when

once the regulating screw on the carburetter has been correctly adjusted the distance between the two nuts represents the lift on the needle.

If an attempt be now made to start the engine it will probably be found to be impossible owing to the jet being too small, and if so, the screw must be raised slightly, a half-turn at a time, until the engine will just start easily with one-third throttle and air lever closed. It is better to find what is the lowest position at which the engine will run at eighteen to twenty miles per hour on the flat on top gear with about one-third throttle and about half air by adjustments with the regulating screw before any attempt is made at adjusting by the handle-bar nuts, as, once

Fig. 4.—Method of attachment to handle-bar

found, this can be assumed as the permanent minimum jet setting, and can always be obtained after any temporary increase from the handle-bar by running the two nuts on the handle-bar tube into contact again.

**The Device in Use on the Road.**

When on the road if undulating country is encountered the needle is raised by turning the large milled nut (the Bowden wire will resist the tendency of the screw to turn if the nut is easy on the threads), the needle remaining in the new position until again altered by turning the nut. If a sudden increase of power is required, as frequently happens in traffic or when starting in cold weather, open the jet by pulling the milled nut away from the tube and holding as long as the increased effort is required. Letting go the nut will allow the needle to return to its normal position by the action of the spring.

This variable jet attachment thus gives a minimum size of jet for light loads and favourable conditions, an infinitely adjustable increase up to the maximum size of the jet, and the possibility of suddenly obtaining this full jet opening without touching the throttle or air levers in cases of emergency.

With regard to economical running, a test was recently made in the following way. The petrol tap was turned on to allow the float chamber to fill to its normal level, and then turned off and the tank emptied. A quantity of petrol, measuring exactly sixty-four fluid ounces, was poured into the tank, the engine started, and, with a passenger aboard, a start was made over an undulating course of thirty miles. The full jet was necessitated on three or four rises to keep in top gear, and one short hill was encountered which demanded a drop to second, but, in spite of this on arriving home, and after making sure the float chamber was again filled to the same level as before, twenty ounces of petrol were measured out of the tank, making the consumption for the thirty miles just forty-four ounces. This works out at slightly in excess of 109 miles per gallon, the previous best with the carburetter as purchased being at the rate of eighty-five miles per gallon, thus showing an increase of twenty-four miles per gallon, which is an appreciable saving.

The size of jet used was a No. 38, and ordinary No. 2 Pratt's petrol provided the power.

FRANCIS E. SCHOFIELD.

Fig. 3.—The carburetter in position on a  $3\frac{1}{2}$  h.p. Triumph.

## THROUGH FEMININE GOGGLES.

A Motor Cyclist's Autumn Ramble in North-west Hertfordshire.

**T**O the motor cyclists who have yet to experience the charm of Ashridge, the following may be of interest. Ashridge is the country house and estate of Earl Brownlow, and the wooded park covers an area of eleven miles. The distance from town can be easily covered in a couple of hours *via* Watford and Berkhamstead or Tring. The Ashridge roads are admirably kept, and the old pensioners of the estate are set apart to attend the highways after passing the hey-day of their lives. One can drive for a number of miles with trees that meet overhead with fern and bracken on either side. The house, a noble old pile, looking like a great cathedral, at one time was a royal palace. Connected with the house is an old sixteenth century courtyard still containing the implements of an old-time tilting ring. The several coach-houses have still their old-fashioned studded doors, but now contain up-to-date cars. The house, together with the lovely rhododendron valley, is only on view on special occasions. Taking the turn to the right past the house brings one to a lodge gate. At the sound of the engine the lodge-keeper hurries from his cottage to open the gate. Following the road brings one to a half-mile of grassy sward; here situated in the midst of a circle of trees is the monument erected to the memory of Francis, 3rd Duke of Bridgewater, father of English canals. This can be ascended by means of a spiral staircase, and many energetic motor cyclists make the climb.

### Aldbury Stocks.

Near the site of the monument is a narrow chalk cutting which leads to the quaint old village of Aldbury, with its historic stocks in the centre of the village by the pond. Green, worm-eaten and rotten they stand as a link with the past and its bygone customs. Unless one has particularly good brakes, the aforementioned way to the stocks had better be abandoned for the more general route. This gradient attacked from Aldbury would constitute something of a freak hill. On the roadway between Ashridge and Aldbury is the most perfect archway of trees that is to be found in this part of the country. On a summer or autumn day, with the sun shining through the trees, the place is perfect. Rabbits scuttle across the track in their dozens to take refuge from invaders, and occasionally a startled deer will gallop across the greensward and become lost to sight amid the wild fern. The "Bridgewater Arms" is an hotel on the edge of the park which caters for the material needs of the motor cyclist, and was a favourite rendezvous of the M.C.C.; and if, when next wondering "where to" for a country spin, the driver heads his machine for North-west Herts, he will be most difficult to please if he is not amply satisfied with the profusion of nature's bounties.

MAY WALKER.

(Top) The monument in Ashridge Park.

(Left) Ashridge House, near Tring.

(Right) The Bridgewater Arms, absolutely on the edge of the park, and a popular week-end rendezvous for motor cyclists.

# A HANDSOME SIDECAR OUTFIT.

A Dutch Motor Cyclist's Passenger Mount.

THE attractive sidecar outfit illustrated is the property of Mr. Robert toe Laer, of Amsterdam, who is well known to many of our readers in connection with the Anglo-Dutch Trial. Mr. toe Laer was recently appointed secretary of the Motoring Committee of the Dutch Touring Club. The machine is a Simplex, fitted with a twin-cylinder V engine rated at 9-12 h.p. (988 c.c.) It has side-by-side valves, and the tappets are protected against mud by means of special shields. Gas is supplied by a Brown and Barlow carburetter. The countershaft gear box provides four speeds, the clutch is controlled by hand, and combined belt and chain drive is employed. The lubrication is by Best and Lloyd semi-automatic drip feed, and also by pressure feed direct to the engine. The spring forks are of the heavy Druid type, and the large motor car head light, it will be noticed, is supported by means of a special bracket. The sidecar, which is Mr. toe Laer's own design, is attached to the machine at five points. The body is carried on special heavy springs, and a Truffault type of shock absorber is provided. An adjustable windscreen and

Cape cart hood and hood cover will be noticed in the illustration.

The sidecar is particularly well equipped, and has provision for spare oil and petrol and a spare tyre, while there is a large luggage carrier at the rear. Both electric and dissolved acetylene lamps are fitted. The whole is enamelled in blue-grey with blue lines, and there is very little nickel plating about the machine. Though built in Holland, most of the fittings are English. In addition to those mentioned, there are a Watford speedometer, a handle-bar mirror, not forgetting the A.C.U. badge on the handle-bar.

A doctor with H.M. High Seas Fleet writes in the course of a letter to us: "If anybody thinks motor cycling a pastime for the young knuts only, he should watch a certain gallant rear-admiral taking corners at 30 m.p.h. on an old Triumph, and that after sixteen months of war! Five of us on board this battleship regularly read your paper, but we do not get much chance of doing any sprinting!"

A MOTOR CYCLIST'S AUTUMN RAMBLE IN NORTH-WEST HERTFORDSHIRE. (See previous page.)  
Two entrances to Ashridge Park. The semi-circular stone seat behind the monument in the left-hand picture should be noted.

## A NEW MODEL DIAMOND.

2½ h.p. J.A.P. Engine, Newly-designed Frame, and Enfield Two-speed Gear.

**A**NYTHING which emanates from the Diamond factory is generally of exceptional interest, because this machine is one of the few where the designer betrays great ingenuity, especially as regards the minor details. Although the new model really is an assembled machine, nevertheless there is scope for much good design in the frame and fittings.

The standard J.A.P. engine unit with a bore of 70 mm. and a stroke of 76 mm. (292 c.c.) is used. This has the magneto supported upon an aluminium platform at the back and driven through a train of spur wheels within the usual curved aluminium cover. Owing to the position of the magneto, a very long straight inlet pipe is necessary, and the Amac carburettor is secured to this pipe.

On the left-hand side is a chain drive, enclosed in a very rigid metal case, and connecting the engine to the Enfield two-speed gear, which latter drives the belt pulley on the right-hand side of the machine through a shaft housed within the enlarged bottom bracket. Adjustment for the chain is obtained by the usual Enfield method of mounting the countershaft in eccentrics, which can be turned to bring the shaft further away from or nearer to the engine, and

The Enfield gear control and its special bracket on the top tube of the new Diamond described on this page

with its extremely pleasing lines, and the photograph shows that the tank in the top tube slopes in the manner associated with the Diamond, the tube below the tank being parallel to the ground and joining the seat pillar at a point some little distance below the saddle. The tank is finished in the usual Diamond green, and holds 1½ gallons of

petrol and one quart of lubricating oil, the two compartments being divided off by two separate walls, so that there is an air space between the oil and petrol, and leakage from one tank will not affect the other. The seam of the tank is in a somewhat unusual place, being at one of the lower edges, at which point the metal is bent over into a peculiar dovetail joint and then soldered. An advantage of this method of construction is that it allows of the various tank fittings being soldered in position before the tank is closed up.

### Frame Design.

It is here, as regards the construction of the frame, that the ingenuity of the designer has had full play. Not only is the head long enough to give adequate supporting distance between two thrust bearings, but the lugs into which the top tube and down tube are brazed have exceptionally strong webs, the tubes themselves being carried right through the lug before the brazing is performed. The bottom bracket is most interesting of all. The bracket itself serves a number of purposes. First of all comes the large housing for the countershafts of the Enfield gear; also there are extensions formed solid with this bracket in order to secure the engine, there being two arms at either side which are drilled to correspond with two of the lugs running across the engine crank case. This makes a rigid job of the engine support, and also gives the factory a chance to drill these pieces more accurately and more cheaply. Beneath the bottom bracket is formed a face which is machined and then fitted with three studs for the purpose of holding a special malleable bracket curving forward as seen in the second sketch. This bracket supports a strong steel tube whereon are the footrest

locked when in the correct position by a large ring. The control rod for the gear slopes upwards, and is attached to the frame by a special bracket. It is probable that the bracket will be placed slightly further forward on the frame in the future, as at present it is rather in the way of any rider having an exceptional length of limb. The drive from the pulley to the rear wheel is taken by a 3in. Avon belt, and the belt rim is drilled both to prevent dirt accumulating within the rim and to take away unnecessary weight.

Looking at the machine for the first time, one is struck

New Diamond single-cylinder four-stroke model. The engine is a 70 mm. × 76 mm. J.A.P. The dropped handle-bars will be noted.

---

IT is worth while to wait when you know it is waiting for a good thing.

Will you wait while we fill the urgent needs of the country—while we help, as far as it is in our power, the men bearing the heat of the fray?

To every Patriotic Britisher the country's needs come first. Will you surrender your personal requirements in this hour of stress while we throw our immense manufacturing resources into the scales, and wait for the day of peace which every moment draws nearer?

## TRIUMPH CYCLE CO., LTD., COVENTRY.

London - - 218, Great Portland Street, W.

The word "TRIUMPH" is written in a bold, serif, all-caps font. The letters are thick and closely spaced. A thick, dark, curved line arches underneath the letters, starting from the left side of the 'T' and ending at the right side of the 'H', creating a sense of motion or a banner.

Testimonial.

Gentlemen, Highgate. Please send me a Rich Tube. I must mention the one I tried and have in use since 1911 is still acting splendidly, and I am now transferring the present one to the front and fitting a new one to the back. They are a boon.

**A New Model Diamond.—**

pads. Most riders will appreciate this construction, because, sooner or later, a machine is bound to have a fall, which bends or permanently distorts the footrests. If the footrest tube is brazed up solid with the frame, not only does the machine become unsightly, but it may happen that the repair of the footrests may involve expensive alterations to the frame. In this particular instance the footrest tubes bend first, and if the damage is not great it can easily be rectified, but in case of exceptional damage the footrest, together with its bracket, can be removed entirely and a new one substituted. On the chain stays there is a special bracket brazed to each stay and drilled to receive the small screws which hold the bottom part of the mudguard, while in the right-hand chain stay is incorporated an aluminium casting containing the lug for the special Diamond foot brake. This brake is most simple, and acts within the groove of the rear wheel pulley, and from the fibre-shod operating arm a spindle is carried through a lug in the chain stay and attached to a long pedal to be operated by the rider's heel, which is simple and provides a good brake.

Underneath view of special footrest attachment on bottom bracket of latest Diamond four-stroke.

Another alteration for 1916 is in the carrier, the side supporting tubes of which form a triangle with rounded "angles," thus making the construction stronger to withstand the exceedingly

rough usage which this part of the machine invariably undergoes. The front wheel is held by a Druid fork of exceptional width, in order to allow of a wide mudguard without cutting into the guard at that point where the forks are placed. Stronger spokes are now used, and special dust-excluding caps protect the bearings at each end of the hub, the same construction being applied to the rear wheel. A somewhat unusual form of T.T. handle-bar is employed, being practically a straight tube from the head to the handle-bar grips. This form of handle is experimental, and was used on one of the Diamond racing machines. It appears to give a comfortable riding position with an extraordinary sense of control.

Studded Avon tyres (26in. x 2in.) are fitted, and the machine weighs about 120 lb. The following measurements may be of interest. The wheelbase is 53in., and the ground clearance beneath the silencer, which is the lowest point, is 5in. From the saddle to the ground, with the machine off its stand, is 28½in.; and as regards the Enfield gear the top speed is 6 to 1 and the low speed 10.5 to 1, ratios which have been found extremely satisfactory.

## A Visit to the Sunbeam Works.

**D**URING a visit to the works of John Marston, Ltd., of Wolverhampton, we were able to inspect a number of Sunbeam motor cycles in the different stages of manufacture, and every facility was courteously afforded us to examine the different parts as they emerged from the different processes. Throughout, the impression conveyed to us was one of first-rate material, exquisite finish, and a care in matters of detail, which attributes in themselves explain the popularity and success of the world-renowned Sunbeam. The Sunbeam Co., like many other leading firms in the motor cycle trade, are constantly being dazzled with large orders for their products, which they are unable to accept, for the reason that a good proportion of the works is busily occupied in the manufacture of sundry munitions of war, and, apart from that, a fair percentage of the output of motor

bicycles has been regularly absorbed by the Russian Government.

During our tour of the works we were particularly interested in the new 8 h.p. twin-cylinder model, and noted the fact that these engines are entirely stripped for inspection and assembled again with Sunbeam care and precision before being built into the frame.

The 8 h.p. engine is really the only change of note in the passenger model, other details remaining in general the same as on the 1915 pattern Sunbeam passenger outfit. The gear box, for instance, is interchangeable. The lubrication of the gears is now effected by a pipe from the two-way lead on the hand pump.

The 8 h.p. Sunbeam is very fast on the road, and is, moreover, quiet and controllable at all speeds. We are told that 55 m.p.h. is quite possible, and T. C. de la Hay, whose name is well-known in

competition circles, told us of a trip he had from London to Wolverhampton which occupied so short a time that we refrain from publishing it.

The lubrication of the 8 h.p. twin is effected direct to the back of the front cylinder, there being no oil entrance to the crank case whatever. The oil is fed from the ordinary sight-feed drip lubricator to a cover plate attached to the cylinder, a ball valve being enclosed in this plate. The pistons have oil grooves formed in the full depth of the skirt. As is well known the front cylinder of a V twin presents some difficulty in the matter of lubrication, and thus, by arranging that all the oil for the engine enters by the front cylinder, adequate lubrication for the whole of the parts is ensured.

The Sunbeam is not cheap, but no one would expect it to be after an examination of the finish, which is above reproach. Complete with a first-class sidecar outfit and every refinement of which the most enthusiastic sidecarist has ever dreamt, the price can be made to come out at very little short of £150.

### BRITISH BOSCH MAGNETOS.

**W**E recently made an interesting tour round the Bosch works in company with Mr. A. E. Bennett of the Bosch Magneto Co. Here we saw British-made Bosch magnetos in all stages of manufacture, and various examples of the excellent workmanship of which the London works are capable. At the present time very few motor cycle magnetos are being turned out, as practically the whole of the energies of the company are being devoted to the manufacture of these instruments for aeroplanes and other military purposes.

The 8 h.p. twin-cylinder Sunbeam, which replaces the 6 h.p. model of the make of 1915. It is essentially a sidecar machine de luxe.

## A Weatherproof Family Sidecar.

A Most Luxurious Millford Sidecar attached to the Latest 8 h.p. Excelsior Twin.

### THE HEIGHT OF SIDECAR LUXURY.

A 1916 model 8 h.p. twin-cylinder British Excelsior, to which is attached a Millford tandem-seated sidecar capable of being completely enclosed. The outfit is equipped in a lavish manner.

**W**E recently had the opportunity of inspecting the latest production of the Excelsior works, viz., a most luxuriously fitted up big twin sidecar outfit. It was built to Mr. Carson's special specification, and is certainly the last word in family sidecars. The machine is a standard 1916 Excelsior twin fitted with the latest 8 h.p. J.A.P. engine,  $85\frac{1}{2} \times 85$  mm., giving a capacity of 976 c.c. A Sturmey-Archer three-speed gear is used in conjunction with chain and belt transmission. A very neat little special fitting on the gear box is a simple device to facilitate the easy and accurate adjustment of the engine chain. It consists of a plate fitting over the four holding down bolts, attached to the rear end of which is a bolt that passes through a loop projecting from the frame, so that by slackening the four clamping bolts and tightening or slackening the nut on the adjuster bolt the exact position of

Arrangement for sliding magneto to take up slackness in chain.

the gear box, and so the tension of the chain, can readily be adjusted. Another fitting to render adjustment easy is the device fitted to the magneto platform. The magneto is attached to a separate

plate which slides on the crank case magneto platform on rails, the whole being held in place by a single large bolt and nut.

The wheels, which are  $650 \times 65$  mm., are very strongly built for heavy sidecar work, having large waterproof hubs and ten-gauge spokes all round. The mud-guarding is most excellently carried out, all guards having deep side valances, while to facilitate the repair of the back tyre the rear portion of the guard complete with the carrier is detachable by simply removing three wing nuts.

Stands are fitted for both wheels. The belt rim brake, operated by a pedal situated in a most convenient position on the right-hand footboard, is fitted in such a way that no matter how it is adjusted the pad presses evenly along its whole surface. The latest Brampton spring forks are fitted, which give an upward as well as a backward movement. Largo Brooks saddle, metal-covered tool bags, upturned aluminium footboards, and the parts which are usually bright finished in black complete the specification of the standard machine.

### The Lighting Outfit.

On the special machine we are describing a Lucas dynamo lighting outfit is installed. The dynamo is situated behind the engine, and is clamped to the saddle tube of the machine. The extraordinarily neat and practical switch box, also containing the fuse and automatic regulator and cut-out, is fitted just in front of the saddle, while the batteries are placed under the seat of the sidecar. Three lamps are included, viz., head, tail, and sidecar side lamp, all controlled by the one switch. The head lamp has a special bulb with two filaments, one giving 10 c.p., the other only 3 c.p., controlled by a switch fitted in the back of the lamp. There is also a small lamp in the hood of the sidecar, controlled by a

The new tandem-seated Excelsior-Millford sidecar outfit.

**A Waterproof Family Sidecar.—**

separate switch, and a powerful electric horn completed the outfit.

**The Millford Sidecar.**

This is one of the most luxuriously equipped sidecars we have seen. The chassis is specially strong, being made on what is known as the cantilever principle; the ordinary chassis is strengthened by a triangulated under-frame. Four-point attachment is used, the main front fixing being taken from the centre of the chassis.

The body is a two-seater, the rear seat being only intended for a child, but both are beautifully upholstered and ample leg room allowed. The whole is sprung on C springs both back and front. Each seat is provided with a separate adjustable windscreen, while under the box-spring cushions of both seats are large lockers for spares, etc.

Method of adjusting position of gear box on 8-h.p. Excelsior.

A hood with side curtains, by means of which the whole sidecar may be entirely enclosed, is fitted, and when not in use is covered by a macintosh cover which can also be made to cover up the rear seat when not required. A foot warmer heated by the exhaust gases, placed in the floor of the front compartment, can be regulated by means of a butterfly throttle. The connection to the silencer is by a flexible metallic pipe. The luggage carrier is attached to the body instead of the chassis, so gaining the benefit of the springing. The finish of the outfit is very fine indeed.

The other Excelsior models are so well known that they hardly need mention.

The two-speed gear used on the two-stroke lightweight is now manufactured in the Excelsior works. This machine, with its chain drive, although not intended to be cheap, is a most workmanlike job.

ANOTHER MILITARY MOTOR CYCLE REPAIR SHOP. Artificers and R.E. despatch riders overhauling their Douglasses prior to their departure on active service. The photograph was taken at a training centre

**MILITARY MOTOR CYCLISTS AT SALONIKA.**

DESPATCH Rider P. J. Cox, a prominent competitor in Irish trials before the outbreak of war, provides, in a letter published in our contemporary, *The Irish Cyclist and Motor Cyclist*, some interesting information concerning present-day life around Salonika. The roads apparently are in an appalling condition, and the mudguards of the W.D. Douglasses quickly get clogged up.

The French despatch riders are not so fortunate in their mounts as their British allies, those in camp at Salonika riding ancient-looking Clements and Peugeot fitted with fixed engines and single gears.

The population do not altogether like the motor cyclists, the arrival of the latter disturbing their peaceful existence. They are accustomed to wander about the streets, and a silencerless Douglas on low gear is rather disconcerting to them.

Lance-Corporal Allen S. Jones, who has spent seven weeks in hospital after twelve months' service in France.

**ANOTHER WAR ZONE BUILT MACHINE.**

LANCE-CPL. ALLEN S. JONES, M.T.A.S.C., while working at a motor cycle repair base in France, put together a Douglas machine from parts of "scrapped" ones. He used it for his work and it proved very successful.

Jones, who is the well-known Welsh motor cyclist, has had an unfortunate time, having been in hospital for seven weeks with an injured hand. He started active service in the early days of the war as a car driver in the M.T.A.S.C. In March he was given a good post in a motor cycle repair depot, where he stayed until sent home with a bad hand. We are glad to know that he is now well on the road to recovery.

Mr. Jack Burnside, formerly of the Quadrant Motor Company, was, we regret to hear, killed in action on the night of December 30th.

**SIDECARS AND ACCESSORIES.**

The issue of "The Motor Cycle" for January 27th will deal mainly with sidecar attachments and accessories of all kinds.

" 17th	...	4.49 "
" 19th	...	4.52 "

## No Green Lights.

A motor cyclist has been fined 40s. at the Mansion House for carrying on his mount a green light which, according to the evidence, was visible at a distance of 500 yards.

## Joining the Automobile Association.

The Executive Committee of the A.A. has arranged a concession with regard to the subscriptions of new members. All new members joining the Association now will be admitted to full membership until April 30th, 1917, at the following rates:

Car owners	...	£2 12 6
Light car owners	...	1 6 6
Cycle car owners and motor cyclists	...	13 6

Plus badge fees of 5s. for car, 4s. for light car, and 3s. for cycle car and motor cycle badges.

## From Northants to Cornwall.

Mr. B. H. Davies (who in the early days did so much for the motor cycle movement) desires to inform his correspondents and friends that his address is now St. Wenn, Bodmin, Cornwall. Motor cyclists calling upon him should follow the Truro Road to just beyond the sixth milestone west of Bodmin, just before the road crosses Goss Moor, where there is a brown stone direction post at a right-hand turning bearing the word "Withiel." His house is two and a half miles up this turning.

## Few Awards in Winter Trial.

The severity of the weather conditions experienced in the winter trial of the Dublin and District Motor Cycle Club in the Wicklow Mountains, a report of which appeared in our issue of the 30th ult., resulted in very few awards being won. Only two of the finishers qualified were won by P. H. Hurse (4½ h.p. offered. The first prize and Binks Cup was won by P. H. Hurse (4½ h.p. B.S.A.), who was the only competitor to score the maximum number of marks, and a silver medal was won by C. B. Franklin (7 h.p. Indian sc.) with 98 marks, a petrol failure in going downhill in a non-stop section causing him to lose two marks.

## A Lighting Disc Tip.

That seasoned rider, R. O. Clark, of Norwich, has evolved an excellent dimming disc that is quickly detachable. It is explained and illustrated in our correspondence pages this week.

## Average Prices.

We give below the average prices of second-hand models offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model the average for the past week is quoted. If there were not at least two advertisements, then the last occasion on which they were quoted is given.

## THE LAST STRAW!

A 4.5 h.p. twin Campion outfit which conveyed the Southwell, Notts, Junior F.C., from dressing room to playing ground, a distance of half a mile, in one instalment. Total weight of passengers was 16 cwt. 2 qrs.

## BROOKS Policy for 1916

is the same as it has been ever since we made our first saddle some thirty-six years ago—Quality first. We *know* our saddles are the best made, yet we are continually endeavouring to improve them—constantly trying to find fault with them, because we are determined you shall not.

Our saddles for 1916 are the result of thirty-six years' tireless research and we offer them knowing them to be as good as even our knowledge and experience can make them.

useful  
book

"MOTOR CYCLES & HOW TO MANAGE THEM"  
— the standard handbook for motor cyclists — will  
tell you practically all you want to know about  
your machine.

There is no doubt as to the supremacy of this book over all others of a similar kind. It is constantly being checked and revised by the staff of "The Motor Cycle," and consequently carries the weight and authority of this journal.

Its contents embrace a multitude of subjects relating to motor cycles, their care and management. It is clearly written and well illustrated. Every motor cyclist—whether beginner or experienced rider—should keep a copy handy for reference.

**Motor Cycle Exports Compared.**

Although the general exports of the country have decreased about 27% as compared with 1913, the motor cycle exports (including parts) have only dropped to the extent of practically 17%. Full information will be found on page 39.

**The New Lighting Regulations.**

A map published on page 38A of this issue explains at a glance the new lighting regulations and where they apply. A point to bear in mind is that the Metropolitan Police area, having its own special regulations, is not affected by the new rules that came into force on Monday last.

**Petrol Imports.**

The high price of petrol is evidently not caused by any shortage of this useful spirit, for the Board of Trade returns show that the amount imported during 1915 was no less than 144,939,700 gallons. This is more than 18,000,000 gallons in excess of the previous year's imports and upwards of 44,000,000 gallons more than in 1913.

**The National War Funds.**

At the week-end the principal war funds stood as follow:

The Prince of Wales's National Relief Fund	(£2,893,000 distributed)	£5,699,666	0	0
The Weekly Dispatch Tobacco Fund		96,396	0	0
The Times Fund for the Sick and Wounded		3,108,674	0	0
The Queen's Work for Women Fund		168,073	17	0
Belgian Relief Fund		1,280,000	0	0
The Farmers' Red Cross Fund		222,000	0	0

**Twin-cylinder Two-stroke Engines.**

In the article on "Twin-cylinder Two-stroke Engines," which appeared on December 30th, the names of the Scott and the Premier are coupled together, but, though these engines are representative of the type having parallel cylinders, they have nothing else in common. The Scott is really two engines placed side by side, but the Premier has no partition in the crank case and does not employ crank case compression, having a separate receiver for the mixture. The remarks which follow the mention of these machines are general, and do not refer to any particular engine.

**SIDECARS AND ACCESSORIES.****SPECIAL NUMBER of JAN. 27th**

will be divided into the following sections:

- (1) SIDECARS.
- (2) GENERAL ACCESSORIES.
- (3) TYRES AND CLOTHING.
- (4) IGNITION APPLIANCES & LAMPS.

The usual features will, of course, be retained.

**New Models in this Issue.**

The following new machines are described and illustrated in this issue:

292 c.c. Diamond.

Two-stroke Hobart.

Weatherproof tandem-seated Excelsior sidecar outfit.

8 h.p. Sunbeam.

**A Farewell Dinner.**

Many motor cyclists who have come into contact with him will greatly regret to learn that Mr. Victor S. Welsford has resigned his position as manager of the Harley-Davidson Motor Co., Ltd. To bid farewell to his many friends in the motor cycle business, in the press, and on the staff of Messrs. Harley-Davidson, Mr. Welsford gave a farewell dinner party at the Holborn Restaurant on Thursday last. The company began serious business in this country after the war had started, and naturally it had an uphill fight. Mr. Duncan Watson presented Mr. Welsford, on behalf of the staff, with a handsome gold cigarette case and an illuminated address, couched in the most grateful terms. Mr. Welsford, in reply, said that he had done his duty, and could not have done it but for the help and co-operation of the staff, and he thanked everyone from the bottom of his heart. He had found American business methods hard. He himself was an Australian, and had English ideals, and he had done his best, but the principals and he had agreed to differ. Of the very large number of Harley-Davidsons which had been sold, over 3,000, in fact 50%, were in the possession of military men

of this country or of the Allies. Of his old staff seven had joined the Colours, and every available man had attested, including himself. He hoped shortly to be serving his King and Country.

**From Cape Town to Enlist.**

The latest recruit to the Motor Machine Gun Service is William Boylin, hon. sec. of the Cape Peninsula Motor Cycle Club, who has come home specially to enlist. There are no vacancies at present in the M.M.G.S. except for such men as Boylin, who have been travelling some weeks and were accepted tentatively prior to their departure overseas. Boylin has acted as hon. secretary of the Cape Town M.C.C. for the past three years, and the doings of this energetic body are well known to our

W Boylin (M.M.G.S.)

readers, the competitions having been described and illustrated from time to time by our local correspondent. During his five years' stay in South Africa Boylin estimates that he has ridden 20,000 miles. Boylin brought away with him an excellent recommendation from the president of the Cape Peninsula M.C.C., Mr. Duncan McMillan, whose name is well known to Scottish readers. Boylin is an expert marksman, and was a N.C.O. in the Cape Town M.I.

Two other readers expected this month as recruits for the M.M.G.S. hail from Sydney, New South Wales, and Trinidad, B.W.I.

**A Natal Hill-climb.**

With summer in full swing south of the Equator many competitions are being held in those of our Overseas Dominions so situated. Of course, with such a magnificent response from Overseas to the Mother Country's call for fighting men, trials are not so plentiful or so well supported as in days of peace, but in South Africa, Australia, and New Zealand there are enough men left to justify an occasional competition.

The Pietermaritzburg Motor Cycle Club held a hill-climb on November 13th, when *The Motor Cycle* formula was used,

Time<sup>2</sup> x c.c.  
i.e.,  
Weight

**Results:**

- ON TIME.
1. H. B. Morcom (3½ h.p. A.B.C.)
  2. A. R. Morcom (3½ h.p. A.B.C.)
  3. R. Goodwin (2¾ h.p. A.J.S.)
- ON FORMULA.
1. R. Goodwin (2¾ h.p. A.J.S.)
  2. J. C. Hunter (2¾ h.p. A.J.S.)
  3. A. R. Morcom (3½ h.p. A.B.C.)

From the above it will be seen that honours were shared by A.J.S. and A.B.C. machines.

Flywheel side of the 1916 model 2½ h.p. two-stroke Hobart described on page 38. Chain-cum-belt drive and a two-speed countershaft gear are fitted

OFFICERS, N.C.O.'s, AND MEN OF A  
MOTOR MACHINE GUN BATTERY  
SURROUNDED BY DESPATCH RIDERS  
OF OUR GALLANT ALLIES.

The M.M.G. battery shown is the 24th, which may be overseas by the time this issue appears. An Italian despatch rider (D. Malvisi, a well-known Italian competition rider), on a 4 h.p. Douglas, is shown on the left-hand. Below is a French rider of a Triumph returning to the trenches with supplies of tobacco and newspapers. Canadian and Russian despatch riders, both mounted on Indians, are shown on the right. The row of men below the M.M.G. battery are the Douglas-mounted despatch riders attached to the 30th Div. Sig. Coy. R.F.

# A Central Control for Despatch Rider Recruits.

New War Office Memorandum. A.C.U. Secretary's Appointment.

FROM time to time we have referred to the unsatisfactory position of many motor cyclists being placed on the different waiting lists of the various motor cyclist reserve committees in different parts of the country, when, in reality, there was little chance of their being called up, owing to the length of the list and the very limited call for men of this class—about ten per month from each section. During 1915 it was no unusual thing for some of the inspecting officers to have lists extending to several scores of names and for an inspecting officer on the other side of England to be issuing urgent appeals for men. Though ourselves wrapt up in recruiting for the Motor Machine Gun Service—an entirely different section, be it understood—the position became so confused that at the end of last summer we entered into communication with some of the different secretaries concerned, e.g., the Rev. F. W. Hassard-Short, Lieut. H. Smith, Mr. T. W. Loughborough, and Mr. S. W. Phillpott. Subsequently we wrote to the War Office explaining the weaknesses of the present scheme and urging the adoption of a central office. Then Mr. T. W. Loughborough, who himself was alive to the anomalous position, laid a workable scheme before the War Office. The out-

come is the recruiting memorandum, dated January 1st, 1916, which has now been issued, specifying the A.C.U. as the central office, and we give below extracts from the amended instructions which are being issued to all the secretaries of the reserve committees and inspecting officers for the Royal Engineers, Signal Section. This does not mean that there are now vacancies for despatch riders; its main object is that motor cyclists of every district shall have an equal chance of being accepted, provided, of course, they are experienced and qualified for the positions.

"In order to ensure that men shall have an equal opportunity for enlistment in the Motor Cyclist Section, Royal Engineers, throughout the United Kingdom, it has been decided to reorganise the present system and to establish one central office to allocate the vacancies amongst the motor cyclist reserve committees.

"The central office will decide the number of men who may be on the list of each motor cyclist reserve committee.

"The motor cyclist reserve committees will keep these lists of suitable men, and will furnish the Central Office with nominal rolls of candidates, showing the dates of their being placed on the list, and with Army Forms B 210.

"When the Commandant, Signal Service Training Centre, or the Officer, 1/c Royal Engineer Records calls for men, the Central Office will submit the names of candidates with their Army Forms B 210. The Central Office will communicate to the reserve committees concerned the names of those selected, and will return their Army Forms B 210.

"Central Office.—T. W. Loughborough, Esq., Auto Cycle Union, Pall Mall, S.W."

## Advice on an Important Question.

In reply to a common query (upon which the W.O. memorandum throws no light), Mr. Loughborough writes:

"As regards the position of men on a waiting list who have been attested under the Group Scheme, I would advise all those who are called up to apply to be put back to a later group. When I have the information I want from the Commandant, Training Centre, I can more definitely say when such men will be required by the R.E., and shall be in a position to give such men a letter which should facilitate their application for postponement of joining up. The actual decision as to whether such a man must go into the infantry at once or would be permitted to wait his turn for the R.E. will be given by the Tribunals."

## Hobarts for 1916.

Improved Frame Design giving Low Riding Position. A Spring Frame under Test.

THE new 1916 model two-stroke Hobart, produced by Messrs. Hobart Bird and Co., Ltd., Coventry, the experimental model of which we described in our issue of November 25th, is now ready. The sloping top tube and wedge-shaped tank—the two chief features of the new model—with the black finish and gold lines, make an extremely attractive little mount. The dropping of the top tube not only gives an extremely low riding position, the top of the saddle being only

System of lubrication on the 1916 model two-stroke Hobart. The oil is introduced into the engine via the hollow crank case bolt.

Right hand side of the latest two-stroke Hobart

Note wedge-shaped tank and dropped top tube.

28in. from the ground, but it also enables a long steering head to be used, while at the same time the strength of the whole frame is increased. The engine is a 2½ h.p. Villiers, 70 mm. bore and stroke, with a capacity of 269 c.c. The lubrication, by Best and Lloyd, drip feed, is now via a special hollow crank case bolt instead of to the induction pipe. The other details, such as the countershaft gear with its substantial chain and belt transmission, the gear change being actuated from the handle-bar, the aluminium footboards and the heel-operated

brake, are not altered for the coming year. A single-speed model, which is exactly similar to the two-speed machine except that footrests instead of hoards are fitted, is also listed. During our visit to the Hobart Works the whole place seemed to be very busy, and we noticed a large stack of front forks ready for the new machines; these forks, which are of the Druid pattern, are, however, manufactured completely in the works. The firm is experimenting with a spring frame, but it is not expected that much will be done in this direction until after the war.

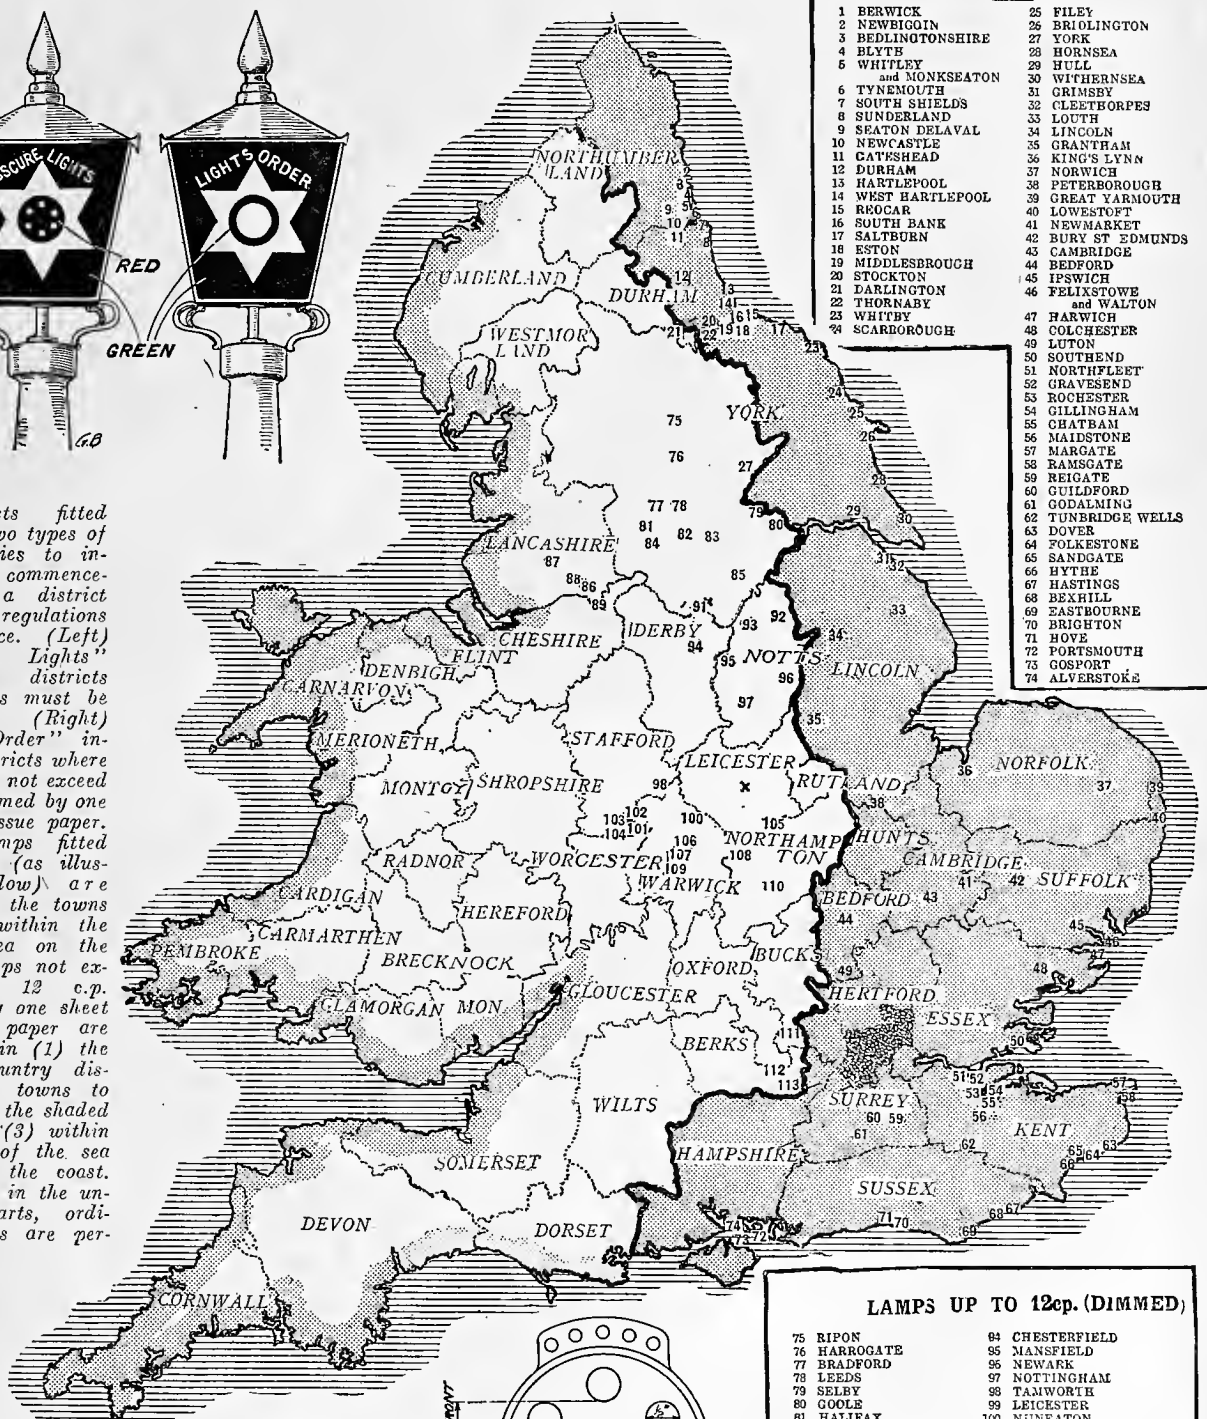

# The New Lighting Regulations in a Nutshell.

Lamp-posts fitted with the two types of transparencies to intimate the commencement of a district where the regulations are in force. (Left) "Obscure Lights" indicates districts where discs must be fitted. (Right) "Lights Order" indicates districts where lamps must not exceed 12 c.p. dimmed by one sheet of tissue paper.

Only lamps fitted with discs (as illustrated below) are allowed in the towns indicated within the shaded area on the east. Lamps not exceeding 12 c.p. dimmed by one sheet of tissue paper are the limit in (1) the shaded country districts, (2) towns to the left of the shaded area, and (3) within six miles of the sea all round the coast. Elsewhere, in the unshaded parts, ordinary lights are permissible.

## AUSTRALIAN T.T. RACE.

### BRITISH SOLO AND SIDECAR SUCCESS: 39½ m.p.h. for 150 Miles on a 2½ h.p. Mount.

THE West Australian 150 Miles Tourist Trophy Race, which took place on Monday, October 25th last, is the event of the year in the Antipodes. The bare result of the race was given on page 16 of our last issue. It was run on handicap lines, the handicap largely being framed as a result of competitors' previous performances in this particular road event.

It was as long ago as 1904 that the first long distance motor cycle race was held in Australia, a rider of a 2 h.p. Minerva getting home first. By reason of being accustomed to racing over very bad road surfaces in West Australia, competitors in races in that part of the world greatly fancy their chances in the British Tourist Trophy Race, and it has been suggested, and, indeed, practically decided, that on the occasion of the next T.T. race, the West Australian expert, H. V. Norton, shall come over to this country in an attempt to carry off the British T.T. Riders at home will welcome Australian racing experts as they have done other Overseas representatives. It is a curious fact, however, that no competition man from over the water has done himself justice in the Manx T.T.'s of the past. Norton's expenses will be borne by the West Australian Motor Cycle Club.

The triangular course of this year's event was from Perth to Guildford, then to York, Northam, and Lloyd Crossing, and back to Perth *via* Bailup, and the official times of the survivors are as follow:

					h. m. s.
1.	L. PERRY, 3½ Rudge (handicap, 45m.) ...	...	...	3 52 50	
	Average speed, 38½ m.p.h.				
2.	H. V. NORTON, 2½ Sunbeam (handicap, 35m.) ...	...	...	3 47 22	
	Average speed, 39½ m.p.h.†				
3.	C. J. LEWIS, 7 Indian (scr.) ...	...	...	3 18 31	
	Average speed, 45½ m.p.h.*				
4.	E. Sylvester, 3½ Premier (handicap, 55m.) ...	...	...	4 23 35	
	Average speed, 35½ m.p.h.				
5.	G. Hard, 3½ B.S.A. (handicap 59m.) ...	...	...	4 32 35	
	Average speed, 33 m.p.h.				
6.	H. Myers, 7 Indian (handicap, 15m.) ...	...	...	4 1 25	
	Average speed, 37 m.p.h.				
7.	G. Davidson, Triumph ...	...	...	6 4 0	
8.	R. E. Webb, B.S.A. ...	...	...	6 23 0	
	* Fastest time.				
	† Second fastest time.				

The winner, L. Perry (3½ h.p. T.T. Rudge Multi), received a start of forty-five minutes from the scratch man, C. J. Lewis (7-9 h.p. Indian).

Norton, who was first in 1913, riding a 3½ h.p. Triumph, and second in 1914, when mounted on a 2½ h.p. Sunbeam, was this year to have ridden a 3½ h.p. Sunbeam, which had been specially sent out to Australia, but as it arrived only the day before the event, it was decided that L. Hope should ride the machine. This rider, despite the fact that he was not acquainted with the make, actually led at half the distance, when a horse suddenly ran out of the bush and collided with him. There were one or two other falls *en route*, some of them due to the nature of the

road. Lewis put up a magnificent ride; indeed, he and Norton had alternately occupied the first position in the races since 1912, which consistency has earned for them the reputation of being the finest riders in West Australia. Norton, though mounted on a machine of such small dimensions as 75×79 mm., and giving a start to quite a number of riders of 3½ h.p. mounts, came very near to winning, and put up the second fastest average of the day, viz., 39½ m.p.h., which is remarkable. This average would have been improved but for the fact that a piston ring of Norton's machine broke away from the step cuts, so allowing oil to get past the piston and on to the plug. Later in the run the plug gave out, and necessitated a change. Lewis, the scratch man, averaged 45½ m.p.h., which gained him third place.

Perry, the Rudge rider, proved a popular winner, his only stops on the road being to change a belt and to replace a broken fastener.

#### Result of the Sidecar Class.

In conjunction with the motor cycle race a sidecar event was arranged, seven competitors starting, no fewer than five of them on 4 h.p. B.S.A.'s, the other two being mounted on a 4 h.p. Calthorpe and a 7-9 h.p. Pope respectively. The winner turned up in W. Franz (B.S.A.), who received eighteen minutes start from the Pope rider. Franz's time was 5h. 1m. 7s., which beat the previous record by about an hour. The performance was considered exceedingly good; Franz had his *fiancée* as passenger. Wilson occupied second place, arriving at the finishing post 45m. later. These two were the only competitors to finish.

Some officials of the Goldfields Motor Club, of Western Australia, photographed on the occasion of a race meeting on the bed of Lake Perkolille, twenty-two miles from Kalgoorlie. Reading from left to right: T. H. Russell (secretary), H. Myers (who has won many events on his B.S.A.), W. J. Plant, E. Ryan, and H. Murfin.

## The Year's Trade in Motor Cycles.

### The Monthly Returns of Imports and Exports for 1914 and 1915 Compared.

**I**N giving particulars culled from Board of Trade returns of the imports and exports for the past two years, it will be noticed that since the outbreak of war in August, 1914, the exports have been decidedly on the small side, and very naturally so, whereas, on the other hand, the imports, which consist practically entirely of American machines and parts, have increased to a considerable extent, especially towards the end of the summer months.

The many reasons for the falling off in British production are well-known to our readers, and so in the scarcity of home-made goods the agents have made up their stocks from outside sources. It is very gratifying, however, to notice that during the last few months the exports have gradually increased from 637 machines in September to the splendid number of 1,690 for November, showing an increase over 1914 figures of 316 machines, whereas, on the other hand, the imports have steadily decreased from 437 in September to 105 in November. That there will be a big demand for British machines overseas when the manufacturers are able to start exporting again in any numbers is almost certain. The following story, which we have already recounted, helps to prove this. On the arrival in Pretoria of a small consignment of British machines there was such a rush for them that

the demand could purchasers sport who were to be the few machines

not be satisfied, so the ingly drew lots as to lucky ones to obtain which had arrived.

#### LUCKY DOGS!

Toronto bow-wows who are unfortunate enough to be run over in the public streets now enjoy the luxury of an Indian sidecar to rush them off to the Humane Society's veterinary surgeon. The London Canine Society has used a sidecar for the transport of homeless cats and dogs for some time past.

#### MOTOR CYCLIST RED CROSS WORKERS.

A Dorchester reader, A House, who has been using his Rudge and sidecar for sixteen months in work for the 5th Dorset V.A.D., of which he is an old member.

#### Fallen Trees.

Sir,—I notice in your issue of December 30th two paragraphs relating to fallen trees. Coming back from Christmas leave about 5.30 p.m. on the Bath-Gloucester road, I had the misfortune to run into a fallen tree across the road. I was fortunately uninjured, but the machine, a  $\frac{3}{4}$  h.p. twin Indian, suffered considerably.

N. HEYWOOD.

#### Improving Mudguards.

Sir,—There is one point about modern mudguards which might easily be improved. The front mudguard is carried well past the front forks and over the tyre. In riding in

Front mudguard design. (Left) Present type. (Centre) Suggested improvement. (Right) Old type. See letter from R. Troward.

wet weather a continuous stream of mud is thrown by the front wheel on to the mudguard. Part of this trickles down the end and is distributed on the rider's feet, if no stop is fitted. The rest—presuming the front projects over the centre of the wheel—runs in a continuous stream on to spokes, wheel, and hub. After a long winter ride the front wheel of a modern machine is coated with an inch or two of mud, whilst an older machine, with shorter mudguards, is often comparatively clean. This is one of the little points which manufacturers do not heed. RIDER TROWARD.

#### British Machines for British Riders.

Sir,—It would be an injustice to the American manufacturers to allow "Cuckoo's" letter to go unchallenged. We are not at war with America, and many of your readers will agree with me that your correspondent "Cuckoo" is allowing his patriotism to run away with him.

Does he mean that a British purchaser (say one like myself, who has taken twenty years to save up the money), after most careful investigation and comparison, believing that he will get more for his money in an American machine than in a British one at the same price, should choose the British one?

\*Why is it not possible to purchase a British machine of 7-9 h.p. for £68 with the wonderful mechanical-automatic (or fool-proof) lubricating system, the 28in. wheels and 3in. tyres of the Americans? If a buyer fancies these three items on his machine, could he be expected to accept something smaller, and of less value for his money, because it was British? In other words, is the quality of our patriotism to be judged by the smallness of the value we are prepared to accept from wealthy British firms in return for our hard-earned money? Besides, why doesn't a British firm step forward with a twelve months (instead of three months) guarantee?

Personally (being a man who has to work fifteen hours a day for my living), I should consider it my duty to myself and to my family to get the best value I could for

my money, whether it was British or American. Another point, many of our own makers cannot supply machines, as they are busy with Government work (for which, of course, they are paid), and one firm asks you to wait six months, while another wants you to wait until the war is over, for delivery. Now, does "Cuckoo" think that if we patriotically waited so long these firms would, in return, serve us at a fair and honest price, and not take any advantage of the great demand and small output which would result? Or would they run up their prices and make it impossible for a poor man to own a motor cycle at all? "Cuckoo" should be quite satisfied with the tax of 6s. 8d. in the £ imposed upon American machines, and he should be willing for neutral and friendly countries to trade with one another. He must be a real "cuckoo" if he thinks we could live otherwise.

W. CARTWRIGHT.

[\*Setting aside the patriotic question, we should be glad to know what American 7-9 h.p. motor cycle to our correspondent's specification can be bought for £68.—Ed.]

Sir,—Your issue of December 30th contained a letter from one "Cuckoo" expressing what must be the views of the majority of your readers, and for which I have been looking for some time in your correspondence columns. I expected to see in your issue of January 6th one or two letters backing up the gallant writer, with, possibly, a note from the editor that such letters only represented a selection from a voluminous correspondence of the same tenor. But no; and though of an excessive diffidence by nature, I will wade in where experts are apparently too indifferent to tread. There is no doubt that the purchase by a British person of an alien motor bicycle or car is a grossly unpatriotic act at the present time, and will be so for years to come.

The facts ought to be stated plainly and without varnish, as they would be in America if the rôles of the respective countries were reversed. In the first place, it is a matter of the buyer's personal interest. Dozens of our manufacturers turn out machines giving far better value for money—better material, wearing qualities and appearance, and, therefore (most important), better second-hand value, than any alien machine, and capable of doing all and more than the most advertised imported article. Secondly, there arises a matter of moral principle.

All our manufacturers are giving their plant, time, and best brains almost exclusively to the service of their country, facing the almost certain loss of their regular business drifting to other quarters; they are losing "goodwill" daily—a goodwill built up at large expense and by a peculiarly British trade conscientiousness and fair dealing—and it is a poor recompense for their self-sacrifice to allow, and even encourage, the American importer to take his callous advantage. The American is drawing gold by the millions from this country when we can least afford it, and the gold is going to the country least fit to have it.

Think! We are fighting this war for principles of justice, liberty, and "might is not necessarily right" against the most savagely brutal and cold-blooded monsters this poor old globe has ever had to support. We are a bloated mediæval monarchy, a feudal anachronism, a back number in the realm of modern progress, according to the sons of the land of liberty. But they lend no support by their responsible Government or by any attempted expression of popular opinion to the crushing of the perpetrators of the foulest and most despicable outrages ever committed

against unarmed women and children since the history of the world began (about 1492, I believe, according to popular American chronology). Further, one prominent American manufacturer (wild sparking plugs will not drag his name from me) actually loves the poor innocent Hun—a moral obliquity only attributable, I think, to a cracked cylinder.

The American nation is merely out to make money out of the war, and doesn't care a red cent who wins so long as it can make a record profit and collar the belligerent markets for such time as any belligerent cash is left. It has established its ethical standard on a cash basis.

This is a cold fact, though poetically expressed to rivet the attention! Our own markets *must* be preserved for our own manufacturers in all branches of our trade for the sakes of those now serving, and who have to live when the war is over.

It will have to be done by legislation, if private morality is not sufficient. In any case, a paper of your circulation and standing can, and, indeed, is bound to help at least one great British trade, whose reputation has never been better or record finer than it is to-day. PENROT.

#### Fitting Head Light Discs.

Sir,—I am sending you a rough sketch of a method of fitting a disc to a motor cycle head light which might be of interest to some of your readers who have frequently to fit and remove the disc, and who require something more permanent than one made from paper or cardboard. It is not difficult to make, and can be very quickly fitted and removed.

The disc is made from a sheet of tin, and is fitted on the outside of the lamp, resting on the metal front. It is kept in position by a clip made from a piece of spring steel soldered or riveted to the inside of the hood. The clip has a hole fitting over a peg riveted in the centre of the disc, and to remove the disc it is only necessary to lift the end of the clip.

Showing how a quickly detachable obscuring disc may be fitted to a motor cycle lamp

I have attached a disc in this manner to a lamp, and it seems in every way satisfactory. R. O. CLARK.

#### The Mysterious Sidecar.

Sir,—I fully appreciate the remarks made by both your correspondents, but I think that they have missed the main idea I was trying to bring out.

Many aeroplane chassis are horrible things, as Mr. Smith suggests, and he is wrong in thinking it is bridges I am objecting to. Far from it, I am merely pointing out that if a chassis is rigid, and yet fastened more or less harshly to a motor bicycle, there will be a series of exceedingly powerful shocks transmitted to the whole frame which really should never pass beyond the points of junction.

The modern sidecar is not an attachment, and I have proved myself that flexibly-built machines can be made cheaply, and that they will stand any amount of knocking about, just as an aeroplane landing chassis stands shock which it could never cope with were it made of rigid steel tubing.

Then again, I can assure Mr. Smith that a reasonable amount of springiness makes a machine most pleasant to drive. It makes as much difference to comfort and to the lasting properties as does the addition of a spring fork to a rigid cycle frame.

Mr. Henderson takes rather the same line. If he admits the facts that over the course of an A.C.U. Six Days Trial practically not one single sidecar finished up without suffering severe damage, how can he possibly say that my statements are "too sweeping"?

Which is the better ideal, a sidecar machine built like a car and costing almost as much (with the driver perched up on a saddle), or a sporting attachment which does not even break up over rough roads so frequently as its heavier brothers?

Then Mr. Henderson speaks of the springing of modern sidecars. He is certainly wrong on this point, because they are not sprung better than a farmer's cart except for pneumatic tyres. A sidecar is sprung in the same way as a farmer's labourer puts a springy board across the bars of a farm cart, and most sidecars are the equivalent of cars having the axles and chassis rigidly attached to the wheels with the body of the car slung above them!

Surely the mechanism ought to have the road shocks smoothed out for it just as much as the body of a passenger. It certainly will not last if this is not done.

I do not doubt the comfort of the Henderson or other good sidecars. I have possibly done as much mileage in them as your correspondent, but it hurts my sense of justice to see the solid mass of sidecar, axle, wheel, and bicycle bumping into irregular pot-holes and visibly bending in the process, when it is not designed to take this bending which we know must take place.

I would like to say that I thoroughly appreciate the interesting remarks made on this subject.

A. M. LOW, A.C.G.I., D.Sc., etc.

#### Spring Frame Design.

Sir,—I enclose a sketch and description of a spring frame which I have patented and desire to place on the market.

The rear part of the frame is built rigid, and moves on a pivot of similar construction to the pedal bracket of a

Mr. H. Humphreys's suggestion for a spring frame.

push bicycle. The spindle is bolted firmly in hooked lugs, which make removal of the rear wheel and rear portion of the frame easy. The top end of the moving portion is held in line by curved slotted plates, between which are buffer springs to receive severe shocks and recoil. The normal springing is controlled by the leaf spring.

H. HUMPHREYS.

Sir,—I am an interested reader of your paper, and the interest with which you have invested the important question

of rear springing for motor cycles has encouraged me to submit the effort in this direction which I enclose. The merit which I claim for my idea is obviously simplicity, the system of dual struts which my design involves being very similar to that employed on some types of front spring forks. Of course, the length of spring and the friction entailed by the movement of the slide might be matters of individual taste. The spring, or rather springs (for the arrangement would be the same for each side of the wheel), could be made adjustable, and the slide could easily be run on ball bearings.

I think my design quite applicable to lightweight machines, if not to sidecar and heavier made ones.

P. MILLS.

Spring frame design evolved by Mr. P. Mills, whose descriptive letter is published on this page.

### Lightweight Sidecar Outfits.

Sir,—As every year sees an increase in the number of two-stroke lightweights with sidecars on the road, it would be interesting to have some more riders' experiences of these. Do the belts and chains stand the weight of a sidecar long without breakage? Also what about the petrol consumption of a 350 c.c. two-stroke and sidecar and the advantages (or otherwise) of an automatic carburettor?

TWO-STROKE RIDER.

### A Short Trip in the Lake District.

Sir,—One of the wildest as well as prettiest mountain rounds in the English Lakes is that beloved of the pedestrian from Keswick past Derwentwater to Borrowdale and Seatoller, thence over Honister Pass to Buttermere, from there over Newlands Pass to Braithwaite and Keswick—a distance of about twenty-two miles.

Any motorist possessing a bicycle of not less than 4 h.p. could and should make the journey. He would be amply repaid for any trouble entailed. The surface of the track on the passes is naturally very bad, that of Honister being particularly so, as will be seen from the adjoining photograph taken just underneath the crag itself. The second photograph is of the same pass nearing the bottom, the surface here being much improved.

The beauty of Derwentwater, the jaws of Borrowdale which open at your approach, the wooded wildness of Seatoller, the grandeur of Honister, the solitude of Buttermere, the refreshing green of Newlands slopes, and the sylvan dale that leads to Braithwaite are items not often packed into such a short trip.

Notwithstanding the fact that this journey was made amidst the showers, when the roads were extremely greasy, it is one that I shall take the very first opportunity of repeating.

(Mrs.) M. BROOKE.

Taking a 4 h.p. Triumph and sidecar through the Honister Pass. (See letter from Mrs. Brooke on this page.)

are as good as the Norton for pace, for simplicity, or for general comfort. The steering is very good, due to the big rake of the front forks, and the engine is vibrationless throughout its big range of speed.

If this letter should catch Capt. Lindsay's eye, I should be much obliged if he would inform me how much Oildag he uses in a gallon of Price's Huile de Luxe, winter grade, and also what advantage the Senspray has over the variable jet B. and B.

I have tried both Amac and B. and B. carburettors on my machine, and find the B. and B. more powerful and much more economical than the Amac, but curiously enough the engine will knock on the B. and B. and not on the Amac.

I only weigh nine and a half stone, and for some five months rode the machine on a 4 to 1 gear with excellent results, except for very occasional knocking, e.g., when accelerating quickly from a right-angled turn. I lowered the gear to 4½, and was very agreeably surprised by the increased acceleration and the absence of knocking.

With the B. and B. carburettor, travelling at an average speed of 25 m.p.h. over give and take roads, I get 105-110 m.p.g. The usual disclaimer!

R. E. BROWN.

### On the Road with a 3½ h.p. Scott Sidecar Outfit.

Sir,—In your last issue "Maj. Grout" queries the accuracy of my statement with regard to the low weight of flywheel on the Scott engine. In proportion to the impulse, the Scott flywheel is, of course, as heavy as any other, but I understand that its actual weight is about 18 lb., whereas your correspondent will probably find that the flywheels of the 3½ h.p. four-stroke single weigh something in the neighbourhood of 30 lb.

I certainly think that the light flywheel of the Scott engine has a good deal to do with its quick acceleration, though I agree with "Maj. Grout" that the absence of friction caused by oil round the flywheels is a factor to be considered. On four-stroke engines of early pattern much power was lost by over-oiling, owing chiefly to oil friction in the crank case, but on modern engines greater clearance is provided between the flywheels and the inside of the casing, so that the loss is not so considerable.

With regard to wear of rear tyre, everything depends upon the individual machine, vitality of engine, action of clutches, and so on. It is obviously impossible to lay down hard and fast rules, and I am not surprised that "Maj. Grout" obtains better results on his Scott than with a four-stroke single or twin.

H. MORTIMER BATTEN.

### Some Fads and Fancies.

Sir,—I have read with much interest the article by Capt. Lindsay, and I absolutely endorse all his remarks re his ideal motor cycle. I also have been riding a 1915 T.T. Norton with Philipson pulley, and consider the machine ideal.

I have owned small twins, two-strokes, and a 3½ h.p. overhead valve twin, all recent models, but none of them

### A Ride through a Bush Fire.

Sir,—A run we had through the Bush when it was on fire may interest your readers.

We left Brisbane one Saturday morning, intending to have a run to a Bush township. We thought it would be cooler riding a motor cycle than to stay in the city and get stewed—it was 120° in the shade—so we formed a party, and left for Burleigh Heads, a town in the Bush some sixty miles away. Everything went well till we came to Dead Man's Gully—the half-way rest. The people there told us that the Bush was on fire between Dead Man's and Burleigh Heads, but we said that as we had come thus far we might as well go on. Little did we know what was brewing for us! The road we were travelling on was a typical Australian road made by the bullock teams sniggling timber from the scrub—all big ruts and bumps. When one's wheels got into these the footboards were level with the road. We bumped and joggled along for three miles, and then we struck the Bush fire. The fire was from one side of the road to the other. Phew! It was hot! One of the party who was riding ahead dropped a tin of gasoline from his carrier on to the road, and it burst. Then I guess we had some fire. It was no use waiting for it to cool down, for all around us the Bush was blazing, so we just rode through it. It was awful! A tree would fall across the road and send up a shower of sparks, which, as a rule, found a resting place down our backs. Anyway, we got through it all, and when we came to a creek everybody dived in. Then we struck black soil—the dread of the Australian motorist—3ft. in dust; we skidded all over the road. We arrived in Burleigh Heads all right, with only one of the party complaining that his eyebrows were singed. We travelled back by train!

This I think will give you an idea what motoring in the Bush is like.

Brisbane, Queensland, Australia.

N. BOYLE, JUN.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

#### Gear for Hill-climbing.

Which does a motor cycle engine the more harm—to try and get up a steep hill on top gear (if possible), or to change down to the bottom gear? Personally, I think it gives power to the engine and also less strain if the bottom gear is used.—J.M.

The great thing is not to let the engine labour. If it is obviously in distress, change into bottom gear at once. Naturally, there is less strain on the engine than when "hanging on" on top speed, and, of course, continuous power is transmitted to the road wheels when the low gear is in engagement.

#### Knocking on a Two-stroke.

I should be obliged if you can tell me the probable cause of a violent knocking on the high gear with a 1911 twin two-stroke and sidecar; gears, 4½ to 1 and 8 to 1. I have only just got the engine back from being overhauled. A new piston has been fitted. Now this is not the same as the older one in the other cylinder. The new piston is very much curved on top, whilst the old one is perfectly flat. The knocking occurs when picking up even on low gear, and continues until both cylinders roar, then it disappears, returning when changing into high gear, and gradually ceasing as the engine turns over faster or into the usual hum. There is also an excessive vibration at high speeds. This is unusual for the machine, and it never happened before. Please tell me also the best setting for platinum points for regular and even firing, and should the magneto be timed when the piston is exactly at the top, or before or after?—J.B.

It is very difficult to say what causes the knocking in your engine, especially as the engine has just been overhauled. It is possible that the new piston is too tight a fit; this could cause knocking. You should make certain the engine is firing regularly in both cylinders, and that both are getting an equal quantity of oil. Both pistons should be exactly the same shape and weight, otherwise you will get uneven running. The difference in the pistons may account for the excessive vibration, as it may have upset the balance of the engine. You should make sure that the ignition is not too

far advanced. The spark should occur about the top of the stroke with the ignition lever fully retarded. On no account have the timing more advanced than this, or you will be unable to run with the ignition advanced, which it is desirable to do to obtain the best spark. The contact points should separate .4 mm.; that is, roughly, the thickness of a visiting card.

#### Wanted, a Foot Warmer.

I have a 3½ h.p. two-speed motor bicycle and sidecar. My wife complains of the cold, and I wonder whether it would be possible to transfer the exhaust gases from the silencer (which is incorporated with the magneto bracket) to the foot of the sidecar and so make a foot warmer. Do you think this could be done inexpensively and be a success? If so, would you please be so good as to advise me how to set about the job?—W.J.H.

The fitting of an exhaust-heated foot warmer would be quite simple. All you would have to do is to connect a metal box or cylinder to the silencer of the motor cycle by means of a length of flexible metallic tubing, taking care that the tube is not made gastight by means of rubber packing. An outlet to the box in the sidecar should be arranged, and a regulator of some kind fitted between the silencer and the warming box. Such a device is actually on the market.

#### Engine Noise.

I own a 1915 2½ h.p. four-stroke. A few weeks ago it developed a sort of harsh rattle in the engine, particularly when going down hill or over twenty miles per hour; the noise then became very bad, causing the footrests and handle-bars to vibrate unduly. Could you please tell me (1) what the trouble is? (2) if it should be sent to the makers, or local repairers, or left alone?—G.H.

We are afraid you cannot well diagnose the trouble without taking the cylinder off and testing if there is any vertical play in the big or little end bearings or in the main shaft. We should hardly think it would be worth sending the machine back to the makers, but we should imagine you could find out the cause of the trouble yourself, or get it done locally. It may be only caused by an excess of carbon deposit, which you

could remove yourself, or it may be that the bearings are worn and need to be renewed. A faulty plug often gives bad running by causing pre-ignition, which might account for the vibration.

#### Lack of Power.

I have purchased an old 3 h.p. motor cycle with a.o.i.v., to which I have fitted a 1913 3½ h.p. model Amac carburetter.

I have also ground in the valves and removed all the carbon from the cylinder and piston. The rings are free in the grooves, the compression is good, and the bearings are in good order. The machine runs evenly and fires regularly, and develops good power while on the stand. I can scarcely stop the engine by applying the foot brake, but when on the road it fails to give sufficient power to pull the machine alone. The magneto timing is correct, and it gives a good spark. It has been at the garage for six weeks, but is no better now than before. I have a No. 30 jet in the carburetter, which has recently been overhauled by the makers. (1.) Can you tell me which is the correct way for the throttle slide in the carburetter? (2.) What can I do to improve the power of the engine when on the road?—E.W.E.

(1.) On the top of the carburetter there should be a small projection, which should register with a hole in the carburetter top. When these two register the slides should be in their correct positions. You can also tell whether they are in their correct positions by seeing whether the respective slides are in the following positions: The throttle is the large outside slide, and should face the opening to the engine, while the smaller inside slide is the air, and should face the main air intake opening in the carburetter. (2.) The fact that your machine gives no power on the road may possibly be due to it being geared too highly. It should be geared about 5 to 1, or even 5½ to 1. The automatic inlet valve must not be fitted with too strong a spring. You should be able just to shake the valve open when holding it by its seating and jerking it against your hand. Make sure the exhaust valve is seating properly and that there is neither too much nor too little clearance between the valve stem and tappet. This should be about one-sixty-fourth of an inch.

**SPECIAL NOTICE.**—Copies of "The Motor Cycle" may only be sent to neutral European countries if posted direct from the offices of the publishers, or by newsgents who have obtained permission from the War Office for this purpose. The publishers of "The Motor Cycle" have obtained the necessary permission, and, consequently, can send subscribers' copies as usual. Before sending through newsgents it is important to enquire if permission has been obtained, as otherwise copies intended for neutral European countries will not be forwarded by the Post Office.

**The Local Taxation Licence.**

**?** I purchased an 8 h.p. motor cycle in 1914, and in 1915 took out a local taxation licence. Later, after having sold this machine, I bought a second-hand lightweight. Recently a policeman called and demanded that I should take out another licence for this machine. Please tell me if this is in order.—E.S.

As you did not possess two machines at the same time, you would be quite within your rights in refusing to pay the second local taxation licence. This licence entitles you to keep and use one motor bicycle. We trust you made this quite clear to the policeman.

**Difficulty in Starting.**

**?** Could you kindly tell me—(1.) Why it is that my machine, a  $4\frac{1}{2}$  h.p. chain-driven single, will only occasionally, and then with extreme difficulty, start with the kick starter? (2.) That oil is continually oozing through the exhaust valve and tappet? (3.) That sometimes when trying to start by running and with the exhaust lifted fully the rear wheel refuses to turn and skids along the ground?—A.I. 1185.

(1.) The trouble is probably due to air leaks in the induction pipe or carburettor unions. For some reason or other the mixture is not strong enough for easy starting. Make sure the plug points are clean and adjusted correctly, separating about  $\frac{1}{32}$  in. The contact points should also be moving freely and should separate .4 mm. (2.) This leads one to suppose that the tappet guide is worn, or you may be using too much oil. A faulty

crank case valve might also cause it to blow out of the tappets. (3.) The trouble mentioned here is due to the valve not lifting sufficiently high, or to a back-fire, or the oil may be rather too thick and be gumming the engine up. Before trying to start you should free it by injecting a little paraffin or petrol through the compression tap and turning the engine round once or twice to allow the oil to work past the rings.

**A Badly Carried Out Repair.**

**?** I have just had my cylinder reground and fitted with a new piston. The cylinder walls are now slightly rough. I find that the engine gets terribly hot and then refuses to pull even when in low gear and on the flat. It has now run twenty miles and appears to be no better than at the end of the first mile. (1.) Were the walls left rough in order that the rings could rub them smooth? (2.) If so, when can I reasonably expect this smoothness? (3.) Can anything be done to minimise the overheating prior to the cylinder getting into condition?—L.H.V.

(1.) The walls should certainly not have been left rough. (2.) The only way that the roughness can be smoothed out is by means of a special grinding tool, the use of which requires a considerable amount of skill. All we can suggest is that you take up the matter with the people who undertook the work, and see what they have to say. (3.) If the cylinder and piston are a good fit the machine should run well, and should not overheat. It is not, however, uncommon not to get such good results from an engine the cylinder of which has been re-

ground and a new piston fitted until it has been run about 200 miles so as to allow the new parts to become sufficiently run in.

**READERS' REPLIES.****Starting a Big Single.**

I would suggest that "E.H.B.'s" difficulty in starting up is due not to his engine, but to his hub gear being gummed by the cold weather. I presume it is a plate clutch. I recently found the same difficulty with a Triumph fitted with Sturmey-Archer gear and plate clutch. By washing out the hub with petrol and re-oiling with a lighter oil I am now able to start up again at first kick. I used Price's Huile de Luxe winter grade on re-lubricating, having previously used the summer grade.—P.P.

**Cover Blowing Off.**

I have read with interest in *The Motor Cycle* the experience of your correspondent "P.E." with regard to cover blowing off, and also that of "M.W.T." who had a similar experience, and how the latter got over his trouble by buying a new rim to fit his tyre—a Dunlop 1915 extra heavy 26x2 $\frac{3}{4}$ . Last spring I fitted a similar tyre to my back wheel, replacing a 1913 Hutchinson Passenger, and had only gone about three miles when the cover blew off, jammed in the forks, and the tyre was destroyed. The foreman in a local garage fitted a new tyre same make, but cut off  $\frac{1}{4}$  in. all round the widest of the two flaps, as we found the cause of cover coming off was that the widest of the two flaps came right across rim into bead on the opposite side and prevented bead of tyre from bedding into the groove on rim. I have gone 1,000 miles up to now without any trouble. Anyone who wishes to fit a 1915 tyre on the old 2 $\frac{1}{4}$  in. rim can easily do so with the help of a pair of sharp scissors, as the whole trouble of blowing off is caused by the extra width of flap going into bead. I hope this will be a help to some reader.—FAIR PLAY.

**EXPERIENCES WANTED.**

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"P.M.D." (Brighton) and "J.D.M." (Cardiff).—De Luxe T.D.C. lightweight. Reliability, maximum speed, and consumption.

"C.A.H." (Bexhill).—3 h.p. 1915 Enfield. Consumption, speed, reliability, ease of starting, gear, and Binks carburetter.

**RECOMMENDED ROUTES.**

TUNBRIDGE WELLS TO ARUNDEL.—R.C.

Tunbridge Wells, Eridge, Crowborough, Uckfield, Lewes, Brighton, Shoreham, Broadwater (Worthing outskirts), Patching Pond, Cross Bush, Arundel.

WENDOVER TO WITLEY.—A.H.W.

Wendover, Amersham, Beaconsfield, Slough, Windsor, Egham, Chertsey, Woking, Guildford, Godalming, Milford, Witley.

**MOTOR CYCLES ON COUNTRY ESTATES.**

This year an unusual amount of timber is being felled, and stewards and others are making good use of motor cycles in visiting various scenes of activity. Above are seen lumber men at work in Bolton Abbey Woods, with a  $3\frac{1}{2}$  h.p. Sunbeam sidecar in the background.

# My Farewell to Harley-Davidson Owners

**T**HE outstanding merit of the "Silent Grey Fellow" has been the means of my making hundreds of staunch friends amongst the Motor-cycling public of Great Britain, so that it is with feelings of keen regret that I announce my resignation as Managing-Director of the Harley-Davidson Motor Co., Ltd.

A short time ago our name was barely known in this country, while to-day the Harley-Davidson is very strongly entrenched in the market. The truly extraordinary success that has attended our efforts is a just reward for the energy and enthusiasm put into this business.

However, energy and enthusiasm alone would never have built up such a colossal business. It is your unstinted praise which you have so lavishly bestowed on your mounts that to a great measure accounts for the extraordinary success we have enjoyed.

In making my adieu, I thank you one and all first for the glad hand of friendship you have extended to me; secondly, for your praise, which alone has so materially enabled us to make good.

N.B.—Letters addressed Hotel Ivanhoe, Bloomsbury Street, London, W.C., will receive immediate acknowledgment.

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILLIFFE & SONS Ltd.,** and crossed **& Co.**

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Illiffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## MOTOR CYCLES FOR SALE.

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

## 145,000,000 Gallons of Petrol Imported.

**A** MILD hint by a leading petrol company of a possible shortage of spirit has set busybodies urging that motoring "which is a luxury" should cease. It sounds a very simple recommendation to those who do not trouble to consider the hundreds dependent upon petrol supplies; but as for everyday luxury motoring, we doubt very much if it exists to any extent to-day. We exclude the man who after a week's hard work in factory or office looks upon his week-end run into the country as a necessary constitutional. So far as the motor cyclist is concerned, that means a consumption of a tin of petrol per week at the outside. Who is to decide whether a man uses his motor vehicle for luxury or as a necessity? What of the munition worker toiling long hours often in unhealthy surroundings? Is he to be deprived of his week-end jaunt in the fresh air, and have to sit at home and brood over his troubles, his machine the while rusting in its stable? What of the hundreds who live in the country, sometimes owing to lack of house accommodation, and use their machines mainly for utility; what of the growing army of commercial travellers who have come to regard the motor vehicle as a convenient means of making numerous calls in scattered districts? These are but a few instances explaining the existing demand for motors and spirit where-with to run them, and we could go on *ad infinitum*. But we are not convinced of the so-called shortage of petrol. A reference to Board of Trade returns shows that in 1913, a peace year, 100,858,017 gallons were imported by this country, whereas last year the total was 144,939,700 gallons. Military requirements count for a great deal, but surely the major call for petrol is for our Army in France, and it is extremely unlikely that petrol comes here and is passed through the Customs only to be transhipped abroad again. One company announces

the shortage, but there is no proof yet that it is general. A climax to the scare would be another rise in price. Who knows?

## The Importance of Exports.

**I**T is a fact, strange but true, that we have met with instances on several occasions of late where British manufacturers are not encouraged to send their motor cycles abroad. That the difficulties which are placed in the way of manufacturers are generally known, we are inclined to disbelieve, particularly as the ordinary observer is educated to suppose that our Government is doing its utmost to encourage exporters to send wares abroad, and so bring into this country the much needed gold in order to maintain our balance of trade. Probably there is a flaw in the organisation not yet discovered, and we do not need reminding of the scarcity of overseas transport. On the one hand, we have the Board of Trade exhorting manufacturers to specialise on the requirements of countries overseas. We further find the question of products for overseas trade put up as an important consideration to excuse a man from military service; yet, boiled down, when our manufacturers try to, and do indeed, fall in with Government plans by producing motor cycles with the firm intention of sending them abroad, they encounter all sorts of unsuspected obstacles.

Some of our leading firms could dispose of more than their whole output abroad were they encouraged to do so, and indeed one firm we know has been patriotic enough to go out of its way to suggest such a course to the Government. Whilst one would imagine that such an offer, which is entirely in conformity with Government overtures, would be immediately seized upon, there is no such enthusiasm displayed. From the national point of view, in order to create an offset against our huge imports, it seems the obvious course to export the whole, or, at any rate, the larger part of the country's output.

## A New Design of Two-stroke Engine.

An Attempt to Cure Four-stroking and Provide a Variable Compression.

**T**HE present clouded position of the two-stroke engine is one which every new and popular piece of motor mechanism has to undergo before it attains full and merited justice. It arises from the fact that many manufacturers are mere copyists, and whenever a new idea seems likely to become popular a great number of makers blindly follow the lead and rush on to the market copies, which sometimes are fairly well up to the original in general design and workmanship, but lacking the essential points which have given the original its leadership.

Not that the two-stroke engine is a new idea by any means, for one of the earliest petrol engines was a two-stroke invented by a Mr. Day. I am not quite certain, but to him, I think, lies the credit of the three-port system. If we except the few spasmodic attempts, the honour of bringing the two-stroke engine into prominence in the motor cycle world belongs to the Scott. This make still stands in a class by itself by reason of its fine design and clever features.

As long as makers confined their efforts to engines with bores of 70 mm. and under, the inherent faults of this system did not expose themselves unduly, and, if one excepted the heavy consumption of fuel and lubricant, one had a fairly satisfactory mount. However, recent developments in bigger and multi-cylindered engines have again brought these failings into prominence, and have disheartened many designers, so much so, that these men have turned to the four-stroke engines for the solution of providing a quiet and efficient motor cycle engine.

### Simplicity an Enemy.

It is strange that, although the two-stroke has been on the market for some years, the general design has not altered one iota. It may seem a paradox, but simplicity has been the two-stroke engine's greatest enemy; it is this apparent simplicity which has kept most manufacturers from venturing into new fields. After all, simplicity is only a comparative term, and if certain parts are essential for the satisfactory working of an engine, it is not good policy to discard these parts and leave a crude, unfinished article.

At present the two-stroke engine has three great faults:

- (1.) Its coarseness in running. By coarseness I mean its lack of flexibility.
- (2.) Its tendency to four-stroke, and sometimes six-stroke.
- (3.) Its heavy consumption in fuel and oil, causing the engine to get into a very dirty state in a short time.

Now these faults have been there all along, and although manufacturers have their own pet ideas, yet the broad fact remains that the only additional refinement in use is the compression release valve, which after all only acts as an exhaust valve lifter.

These three faults are all inter-connected with each other, and to get at them we must reason out exactly what happens in a two-stroke engine, say with crank case compression. Now I am of the opinion that the first and greatest defect lies in the fact that, no matter what the setting of the throttle is, you get the same degree of compression in the combustion chamber when the piston is at the top of its stroke. This is exactly the reverse of what occurs in a modern four-stroke engine, and it is this which causes the lack of flexibility. Excluding for the moment the release valve, by the opening and closing of the throttle we may have all the variations of mixture in the cylinder from one-fifth new gas and four-fifths old exhaust gas to four-fifths new gas and one-fifth exhaust gas, but the moment the piston covers the exhaust port we have the cylinder full of some sort of mixture. This is the root of the whole trouble, and is the cause of the hit-and-miss firing, commonly called four-stroking.

### Inefficient Scavenging.

Let us consider the crank case as a pump first. It stands to reason that should you give full throttle to the engine the piston will draw into the crank case a full supply of new mixture, and it is this new mixture that pushes the old gas out. Now you cannot push more out of the cylinder than you force in, so when the throttle is open, say one-fifth, then only a fifth part of new gas can enter the cylinder and only one-fifth of exhaust gas is expelled. Yet when the piston rises it will compress a cylinder full of very poor mixture and the spark will not ignite it. The piston has to go through another cycle and force in another one-fifth of gas before the mixture in the cylinder becomes rich enough to ignite. This is four-stroking. Fourteen years ago De Dion Co. controlled their four-stroke engines by trapping a portion of the exhaust gases and thus maintaining a constant compression pressure, but they soon discarded it, for not only did it cause the exhaust valves to burn, but overheating and lack of flexibility were the results.

This is exactly the same thing that occurs in the present-day two-strokes. You do not notice the fault so much with the little 65 mm., for most of its running is at a pretty constant speed and with sufficient supply of gas to enable the cylinders to be well cleaned out. When traffic, etc., calls for slower

**A New Design of Two-stroke Engine.—**

speed the compression release comes in handy, and so it does not show up its defects.

**A Variable Compression.**

What is wanted is such an engine that, when you give it, say, quarter throttle, a fourth part of a charge will be in the cylinder when compression takes place, and when you have this you will get in a single-cylindered two-stroke the variations of speed you get at present in a well-tuned four-stroke twin engine.

It may seem a big job to design such an engine, but if we lay down certain points as essential and try to work up to them, the task is easier than it looks. In the first place, if we are to have an engine with a range of speeds similar to that of a good motor car engine, then we must have variable compression; secondly, to enable the engine to run slowly, we must have efficient scavenging at all speeds and at all variations of the throttle. Again, to make the engine more economical in petrol, we must discard the compression release valve as a wasteful fitting, or use it only for starting purposes.

The oiling and carbonising difficulties will right themselves, provided that you have a cool engine.

Now to get variable compression in a two-stroke means that you must employ some sort of valve which *can* open at every compression stroke of the piston, and this, in my judgment, is the solution of the whole problem. Up till now we have had variable compression in the crank case and constant compression in the cylinder, whereas the reverse should have been the case.

If we put a mechanically operated release valve in the cylinder head, with a variable opening we could get variable compression in the cylinder, and we could pass back to the crank case, if need be, some of the mixture in the cylinder before it became ignited. By doing so we could discard the throttle and keep the crank case compression constant, say at 5 lb. per sq. in.

This is the most feasible solution of the problem, so let us see how it will work. By doing away with the throttle and allowing the crank case to get (by the aid of the piston) a full supply of gas, when the piston descends, this supply, being at a constant pressure, independent of the speed of the engine, would make certain that the exhaust gases were all expelled. Now that we have attained one of our points, let us see what happens to the mechanically-operated release valve. By giving it a variable lift or opening; the amount of mixture passed back to the crank case can be accurately controlled, and the pressure on the piston when it is at the top of its stroke will vary, according to the wishes of the driver, in exactly the same way as in a four-stroke engine. Thus the range of speed will correspond more nearly to that of a twin-cylindered four-stroke engine, and when slow

and quiet running is necessary you will have it in the natural way, *i.e.*, by less gas being fired in the cylinder and giving a softer thrust to the piston. Not only so, but the waste of unused mixture which goes on at present when the compression release is opened is stopped, and this helps to keep down the petrol bill.

**A Mechanical Release Valve.**

The drawing shows how such a design will look. The only additional mechanism required is the cam A, rocker B, push rod D, and overhead rocker G, so that the arrangement is neither costly nor intricate. The opening of the release valve is on the beginning of the compression stroke just after the piston has passed the exhaust port, for by passing the mixture to the crank case at this moment there would be no chance of a back-fire. The rod D and rocker G are enclosed, and advantage has been taken of the tube F to make it the means of communication between the release valve

and crank case. It will be noticed that the cylinder head is made detachable. This is not only for convenience, but it is the idea of the writer that in a short time we shall have both the cylinder heads as well as the pistons of most air-cooled engines made of the new aluminium alloys, which have been talked about so much lately. These, together with a turned steel or fine cast iron cylinder, should go far in solving the overheating difficulty, and so be the means of saving an immense amount of lubricating oil, which in turn will lessen the amount of carbon deposited on the pistons, etc.

In this article I have tried to bring forward reasons for the existing faults of the two-stroke engine, and to show that these faults are mainly due to the present throttle arrangements, and also how they could be remedied. At present, experimental work, so far as the larger firms are concerned, is dead, but I believe that in the near future the two-stroke will show how its faults have been realised, and what

steps have been taken to eliminate them, while its inherent advantages of simplicity, in the number of valves and power impulses, render it the coming engine for motor cycles and light cars. JAMES MARTIN.

A design for a two-stroke engine, embodying a mechanically-operated release valve, evolved by Mr. James Martin. The letters are referred to in the description on this page.

**NEXT WEEK'S****Sidecar and Accessory Issue**

will be divided into the following sections:

- (1) **SIDECARS.**
- (2) **GENERAL ACCESSORIES.**
- (3) **TYRES AND CLOTHING.**
- (4) **IGNITION APPLIANCES AND LAMPS.**

The usual features will, of course, be retained.

# AUXILIARY COOLING DEVICES.

A Review of Some Aids to More Efficient Air-cooling. Are the Orthodox Cast Iron Fins sufficient?

THE very instructive paper which was read by Mr. Lanchester to the members of the Institution of Automobile Engineers\* causes one to pause and consider whether the present almost general method of cooling a motor cycle engine by casting fins on the cylinder is really the most satisfactory and efficient. One remembers only too vividly the rapid carbonisation of the cylinder head and piston, pitted and broken valves, and the frequent plug troubles and other difficulties, all due in the main to excessive heat generated by even the most modern motor cycles. Cars having liberally water-jacketed cylinders suffer no such troubles. This naturally leads one to assume that the present method of carrying out the cooling system which has been general for so many years has, nevertheless, not reached a stage where improvement is impossible. Though casting radiating fins with the cylinder may be the neatest and most convenient form of cooling, there is little doubt but that the integral cast iron fins can be improved upon. The air-cooled motor cycle engine does not exist which, fitted with only the orthodox method of radiating fins, will not overheat to some degree if driven for any length of time overloaded. Overloading is undoubtedly the prime cause

The radiating fins drilled to take copper tubes, a practice favoured by many racing riders.

of overheating, and the reason the modern motor cycle engine does not show much signs of distress owing to this trouble is that by increasing the volumetric efficiency of the engine by improving the design of the cylinder, valves, and valve ports, timing, pistons, carburation, and so on, the engine has become generally more efficient, and, therefore, is not so easily overloaded, with the result that overheating does not now make itself noticeable so readily. That this is a fact is proved by the air-cooled cycle cars fitted with engines which give absolutely perfect results when used on motor cycles, but when made to drive the more cumbersome four-wheeler do not run so sweetly, and show a decided tendency to overheat. Besides, a considerably increased quantity of oil is necessary in order to keep the engine running satisfactorily, the extra heat burning the oil away very rapidly, and so causing rapid carbonisation, and, of course, less efficient running.

## How the Cooling is carried out.

The idea of all cooling systems is to carry away the heat generated in the

cylinders, and transmit it in the shortest possible time to the atmosphere. This is accomplished by exposing a very large surface to the air, the larger the surface and the better the heat conductive powers of

Coiled wire as a radiating medium, fitted to a De Haviland (the forerunner of the modern Blackburne) cylinder in 1904.

the material used the more efficient will be the reduction of heat. It is clear, therefore, that the surface (whether it be the radiating fins of an air-cooled motor cycle engine or the radiator of a water-cooled one) should be made of a metal with the best heat conducting properties in order to obtain rapid and most efficient cooling. The finest con-

Harcourt radiators as fitted to a single-cylinder engine. Note the considerable extra cooling surface obtained by their use.

ductor of heat is silver, but the cost of this puts it out of consideration; next comes copper, which is nearly ten times, and aluminium nearly five times, better in this respect than cast iron.

## Departures from Standard Practice.

In the original Lanchester cars manufactured between the years 1900 and 1904, which proved in many respects quite satisfactory, the cylinders were cast absolutely plain, the cooling surfaces or radiators were fitted afterwards, being formed of either copper or aluminium spun discs which were shrunk on after the cylinder had been machined, thus enabling the cooling surface to be considerably increased, the thin fins occupying much less room than the cast ones.

A curious device was fitted to the American Knox car. In this instance the cylinders were cast quite plain, and into them a very large number of copper pegs were screwed, deeply grooved with a coarse thread. This device afforded a very large cooling surface, and proved quite satisfactory, especially when used in conjunction with fan cooling.

Several other devices somewhat similar to these have been used from time to time on motor cycles, but for some reason or other have never become popular, probably due to the fact that the appearance was not so attractive as the cylinder with radiating fins cast in one piece. In 1905 an engine was produced by Mr. de Haviland, now well-known as an aviator, and the original designer of the present Blackburne engine. This engine had a cylinder which was perfectly plain, and the cooling was effected by continuous wrappings of D-shaped coils of

Type of corrugated copper fins, as fitted to an old Aster air-cooled engine.

copper or brass wire; this was found most satisfactory, and the possibility of damage was greatly minimised. These coils were bound round and round the cylinder as seen in the illustration, and formed fins exposing a very great surface to the air, and also had the advantage that the angle of the cylinder did not interfere with the efficiency of the cooling. A number of years ago the Aster Co. made an air-cooled engine, the fins of which were of copper and separate from the cylinders. These were corrugated in shape in order to give a greater surface exposed to the air, and were shrunk on to the cylinder in a similar manner to those used on the Lanchester car.

## Auxiliary Devices.

A point which helps to prove that more efficient cooling would be beneficial is the improvement effected by the adoption of cooling devices such as Harcourt radiators, Koolah radiators, and Cool-guard springs, especially when used on sidecar outfits and two-strokes. These devices are designed to be fitted between the ordinary cylinder cooling flanges in order to expose a greater surface of metal to air currents.

\*Extracts appeared in *The Autocar* of December 18th, and a review in *The Motor Cycle* of December 23rd, 1915.

**Auxiliary Cooling Devices.**

Harcourt radiators made by Messrs. Wylie and Lockhead, of Glasgow, consist of aluminium plates with soft copper studs at one end. These plates are pressed between the existing radiators, and are held in place by the soft copper studs; by this means the existing cooling surface is very greatly increased. Koolah radiators are very similar in design, but are attached to the cylinders by means of springs, and are, therefore, readily detachable.

A device adopted by many racing motorists in the past was to drill the cylinder fins from top to bottom and insert lengths of copper tube. Such an

arrangement was fitted to the big J.A.P. twin which was used with such success in hill-climbs a few years ago by Mr. Mackenzie Cott.

Coolguard springs consist of oval-shaped springs which spring over the cylinder, the thin edge pressing between the flanges

"Coolguards"—oval-shaped springs which fit between the existing fins to increase the cooling surface.

**SOME J.A.P. ENGINE IMPROVEMENTS.****A New Adjustable Valve Tappet.**

THE accompanying sketches show two J.A.P. valve tappets, and of these the left-hand one is the latest pattern. It will be seen that that part of the tappet which strikes the foot of

J.A.P. adjustable valve tappets. (Left) New type. (Right) Old type.

the valve stem has been, so to speak, reversed. This has the result of allowing the head to be much more readily accessible, and consequently greatly facilitates adjustment.

**The Oil Pipe Union.**

In the case of a drip feed it is necessary that there should be no possibility of a blow back, and attention to matters of this kind on the part of designers has much to do with the results shown in the hands of a rider. On the J.A.P. engine, when the oil enters the union, which is shown in part section fitted to a crank case, the suction draws the disc valve on to its lower seating, and allows the oil to flow through by means of saw cuts in the lower portion, and on the

down stroke of the piston the small disc is blown by the crank case pressure off the lower seating on to the upper one, thus preventing a blow back up the oil pipe.

**AN ALTERATION TO DOUGLAS SPRING FORKS.**

AN officer of our acquaintance at G.H.Q. in France has a special method of treating the spring forks of all Douglas motor bicycles—and these number about eighty—which come under his care. Readers will remember the horizontal curved links on these forks, and the bolts, nuts, and spring washers which connect them. His method is to braze the bolts, nuts, and links together on one side, as if this is not done the bolts or spindles are apt to seize probably through want of lubrica-

tion, and when this happens the only bearing surface available is the hole in the link, which, on account of its narrowness, rapidly wears through. Already one junior suffered a severe fall through this happening. Such a contingency is not likely to occur in England, and certainly will not do so on the new W.D. Douglas.

in a similar manner to the other devices which are designed to increase the cooling surface. The fact that auxiliary devices have undoubtedly proved infinitely superior to the present orthodox method of air-cooling is being gradually realised by leading manufacturers, who are experimenting with such fittings as aluminium cylinders, pistons, and so on. As an outcome we should not be far wrong in predicting that in the near future the air-cooled motor cycle engine will not be far short in cooling efficiency of the water-cooled type, while the weight, complication, and general nuisance of the latter (especially in frosty weather) will be missing.

**A NOVEL SPARKING PLUG.**

WE illustrate herewith a sparking plug which is the invention of Maurice G. W. Burton, formerly secretary of the Cambridge University M.C.O., and at present a lieutenant in the A.S.C. (M.T.)

The chief point about the plug is the design of the electrodes, which are so arranged that sooting should be impossible. The gap is at the apex of a cone or conical passage directed into the plug body, so that the gases as they are compressed in the cylinder will pass through the spark gap with increased velocity, carrying with them any foreign matter which may tend to accumulate on the electrodes. This foreign matter can then be drawn off or drained away from the passages formed at the base of the cone.

The idea is that the cone acts as a venturi tube; it is certainly novel and ingenious, but not having tried the plug we are unable to say whether or not the inventor's ideas have been attained in this particular.

DESPATCH RIDERS STATIONED SOMEWHERE IN NORFOLK.

We are told that each of the four men shown covers on an average 2,800 miles per month. Their names are: Corporals Webb, Russell, Ingledew, and Binder—all on Douglases.

## OCCASIONAL COMMENTS.

By "IXION."

**Tot Homines, Quot Sententiae.**

Differences of opinion would tend to be less acrimonious if controversialists would give each other credit for a little commonsense and sincerity. Here is a case in point. My pen has been straying of late into remarks upon the merits and demerits, the future and the past, of four-cylinder motor bicycles. During a given week I receive, perhaps, a dozen letters on the subject, most of them apparently from well-meaning and well-educated men, all alike keen on the best interests of the sport and hobby. To some of them the four-cylinder is *anathema maranatha*: their very pens splutter on the paper as they discourse of its lubrication, its decarbonisation, its shaft drive, and so on. Others, on the contrary, write with cool, scathing derision of all other types of engine. Knowing a good deal on the subject from much personal experience of fours, I am hardened in my conviction that neither the shaft drive nor the four-cylinder engine is exactly ideal for the average user, but that, on the other hand, a clever and thoughtful rider, with a little surplus leisure, may be better suited by a shaft-driven four than by anything else. Putting this very sane and judicial conclusion on paper, I am naturally bespattered with venom by three separate classes in the community, viz.:

1. The designers and vendors of four-cylinders, whose partiality is largely pardonable and natural.
2. The duffer owners of four-cylinders, who expect a motor bicycle to be as self-sufficing as a corkscrew, will not realise that they have bitten off more than they can chew, and simply hate to hear a single word said in praise of a machine which has bested them.
3. The expert and practised riders of four-cylinders, whose comparative experiences of simpler makes are often limited, and who simply do not know what duffers the rank and file of motor cyclists still are.

**Another Case in Point.**

Quite early in the motor cycling era I drove a certain single-cylinder machine over 10,000 miles without a single deliberate decarbonisation, the carbon being merely removed twice as a kind of accident, when the piston rings gave trouble. I have not the least doubt that similar claims could be made in respect of modern high-efficiency engines by a very few riders in the kingdom. If we equip a very cautious and methodical rider with, say, a 4 h.p. Triumph, which is thoroughly well run in; if he never takes out a sidecar and never "scraps"; if he uses a first-rate oil, and injects it with great precision as to quantity and frequency; if he eschews throttle braking; it is more than possible that after, say, 4,000 miles his engine would still be eminently usable.

On the other hand, most new engines require decarbonisation in ordinary hands before the first 1,000 miles are up, and the average owner, whose oiling is short of precision, who often uses a sidecar, or goes in for speed stunts, or is keenly fastidious about the running of his engine, certainly begins to speculate when a convenient moment for the job will arrive as often as his speedometer changes the figure in the extreme left-hand niche of the mileage register.

So, if one rashly hints that comparatively few engines

run much over the 1,000 miles between decarbonisations, one is between the devil and the deep sea—the individual who is getting his 3,000 or 4,000 on each dismount of the cylinder, and the confused, roaring, billowy crowd who are "decylindering" every 800 miles or so, and are proportionately enraged because their compression is worse than when they started on the job.

**Verdant Green.**

This tale has a moral. Indeed, it bites down so deep into the universal experience of motor cyclists that in future ages it may even crystallise into a solar myth. Verdant Green bought a motor bicycle; one of the best; the kind of lordly sidecar puller that is listed at the price which a good second-hand light car would fetch. Moreover, he bought it in war time; and so, when the makers' packer sought a book of the words to put in the tool bag, only the 1915 edition was available. In this 1915 manuscript the guileless reader was informed that the oil was turned on when the tap handle was parallel with the oil pipe. Nobody dreamt of adding a marginal gloss to the effect that in "our 1916 model" the oil tap worked in exactly the contrary way. Verdant Green received delivery by train and lorry. Verdant Green, like a wise man, worshipped the machine for a time and times and half a time before he dared to do more than straddle it shyly in the garage. He also learnt the book of the words by heart, and read three copies of *The Motor Cycle* from cover to cover, including the small prepaid ads. Then the sun shone out again, and Verdant Green took the road. For a few miles all went well. Then horrible noises manifested themselves in the engine's belly, and Verdant Green, being less verdant than you might suppose, brought the machine home by train, and tore round to fetch the local expert to look at it. Quoth Verdant, "She" (he had already recognised the intrinsic femininity of our capricious little tormentors, you see!)—"She gets very hot, and clanks loudly; *The Motor Cycle* says that means she doesn't get enough oil!" The local expert (a sporting plumber) promptly suggested that the oil was turned off. V.G. quoted the book of the words at great length. Unconvinced, the expert set to work to verify the point by disconnecting the oil union. The oil union was very tight. Moreover, it was attached by a drip valve and another nut to a light tube. The whole contraption turned under spanner suasion, whilst the nut remained refractory. The plumber waxed impatient. He forgot all he knew about nuts, which wasn't much, and pulled hard. He ripped the whole contraption out of the tank. Point for our Legal Editor: Should Verdant Green pay the makers' repair bill of £6 odd (new bushes, new tank, etc.) on the ground of his greenness, and on the ground of the plumber being such a very local expert? Or should the makers put the machine right gratis, on the ground that their book of the words lied, and that their tool kit was grotesquely inadequate? Oh! I nearly forgot the moral. My dear reader, *always* verify the oil-feed of your new machine by unscrewing a union, and buy two special spanners for the job, unless you wish your last state to be worse than your first.

## TWO-STROKE ENGINES.

### THE CAUSE AND REMEDY OF RATTLE AND FOUR-STROKING.

**T**HERE has been much discussion of late on the subject of engine rattle in two-strokes. Now

I am quite convinced that in nearly all cases this rattle is simply due to overheating or a dirty engine—generally a combination of both. When my engine got to the worst stage of “rattle,” it would never make a sound of it if suddenly accelerated from cold up to 30 m.p.h., while when warm it got very noisy directly the speed exceeded 20 m.p.h., though, strangely enough, it was always silent below that speed even if very hot. I also found that a thorough cleansing of piston and cylinder cured it at once, and that then it would reel off mile after mile at 25 m.p.h. without a sign of rattle or overheating. Overheating can always be detected immediately by raising the exhaust (compression release) when travelling at a good speed; if quite cool there is no sound but the hissing of the release valve; if getting hot a rattle will be heard, and this long before any distress is shown by the engine’s pulling powers. I always use this plan by which to regulate my drip-feed, as I find, to get the best results and economise in oil as well, the regulator wants frequent alteration to allow for hills, speeds, temperature, and fullness of tank, all of which cause a variation in the drip-feed to be necessary.

When a two-stroke begins to run badly, to overheat and rattle, a temporary improvement can often be effected by simply taking off the exhaust pipe and taking out the sparking plug. The first place to become choked by carbon is always the exhaust port, and this makes a tremendous difference to the running by causing bad scavenging; some amount of carbon can be dislodged from top of piston and inside cylinder with a screwdriver through these two apertures, and the port itself carefully cleaned. This is only the work of a few minutes. Of course if time allows, taking down the cylinder makes a proper job of it. Back pressure through a choked silencer also badly affects scavenging in a two-stroke.

#### Four-stroking.

Almost every week questions are asked anent “four-stroking.” I have a Levis which was very prone to the fault, never two-stroking regularly unless it has considerable load, such as a hill, a head wind, or when accelerating, in which circumstances it fired properly and regularly. I tried a larger jet (it was fitted with a 24 Amac) which at once accentuated the fault, showing plainly that the cause was too rich a mixture. I then fitted a 22 jet. At first I could

not get it to run on that; it continually fired back through the carburetter. However, I persevered and discovered that by keeping the air lever closed till the engine was quite warm and then opening it very gradually it would run as well as ever it did, and climb hills quite as well; and when the engine was once running well, I could keep the air lever fully open at all positions of the throttle except full throttle for a steep hill. Also this entirely cured the trouble, and now I know if it four-strokes down a slope that there is one cause and only one—too much oil—and that is handy to know at night. Incidentally, the consumption has been raised from 90 to 120 m.p.g., and the engine runs much cooler; I always fancied there was something wrong when I could start with air lever fully open.

#### The Position of the Sparking Plug.

As regards plug position, surely the best place is at the back just above the transfer port, so that it gets the benefit of the cool inrush of mixture every induction. I had some trouble with plugs and found that a well-known plug sooted up very much. Some eight months or so ago one was advertised in *The Motor Cycle* at 1s. 6d. (I believe it is dearer now) by using a coupon in the advertisement. I tried one and it has run now 3,000 miles without once cleaning and still works perfectly.

There have been many theories expounded as to why a two-stroke should rattle and a four-stroke should never make the same sound. I think, from observation, that the cause is to be found in the shape of the piston head. In the four-stroke this is at right angles to the sides, in the two-stroke it slopes off at a very sharp angle from the cylinder walls. When cleaning I noticed that carbon had formed considerably in this angle and was finely polished by friction. The removal of this carbon at once cured the rattle. It seems that this carbon “ring” fills up the space at the base of the piston head just as the piston ring does lower down, but having no recess or spring to draw back, when the least contraction is caused in the upper part of the cylinder by the expansion of the metal by heat (rather a paradox but true) this ring of carbon hits the cylinder on the upstroke, and thus causes the rattle.

“Rattle” is not caused by pre-ignition, as when the spark is too far advanced an ordinary “konk” is produced. Again, as to various mixtures, I find a weak mixture causes backfire, and an over-rich mixture causes four-stroking.

ROYLAT.

## MILITARY NOTES.

INTERESTING ITEMS FROM THE WAR THEATRES.

HOW MANY ALLIES MOTOR CYCLES?

### MECHANICS WANTED.

THERE is an opening for a dozen expert motor cycle mechanics acquainted with Clyno motor cycles. These men are required for duty in one of the Mechanical Base Depots in France. Accepted men will be enlisted under special arrangements with the War Office, and, presumably drafted to the A.S.C., M.T., and will be required to proceed to France at once. Applicants should mention age and experience, enclosing photograph, in an envelope marked "Overseas," and address their letters, not to the Editor, but to the Clyno Engineering Co., Wolverhampton.

### HOW MANY MILITARY MOTOR CYCLES?

HOW many motor cycles are there in the British Army, or, to go one better, what is the total number of motor cycles in use by the Allies? Here is an interesting problem for readers. No official figures have been published; indeed, we very much doubt if they are available, so that it cannot be deemed an injudicious act for amateur estimators to get to work. Great Britain, of course, uses the largest number of motor cycles by far, as they are employed not only largely for despatch riders, but also in the transport of machine guns and for the conveyance of officers on

inspection work. The numbers might be anything up to 10,000 to 12,000. As regards our Russian ally, over 3,000 machines were employed by the Russian Army in the first year of war, and the number has been constantly augmented by regular British and American supplies. The French Army possesses a great many motor cycles and sidecars for despatch riding, ambulance, and general utility work, but not so many as England or Russia. The Italians use motor cycles very largely, both solo mounts and sidecars, and there are a good number of motor cyclist messenger carriers attached to the Belgian Army. All told, we should estimate that there are more than 20,000 motor cycles in use by the Allies, and every week the number is being increased.

### "THE MOTOR CYCLE" IN FORSAKEN PLACES.

THE photograph of despatch riders attached to the 35th Division Signal Company, reproduced on this page, was taken a few days ago, but by the time the issue is published the men will probably be out of England. They have completed their training in a dreary part of the country, and Sergeant Frew Jones, in sending us the photograph, says *The Motor Cycle* has been most appreciated "in this forsaken place."

### DESPATCH RIDERS ATTACHED TO 35th DIV. SIGNAL CO.

(Back row from left to right) Q. M. S. Instructor A. E. Shaw, Corporals H. H. Goodhead, A. Pembroke, A. M. Nias, T. B. Little, H. C. Love, Art.-Cpl. A. H. Barnsley, and Corporal Yarnold. (Centre row) Corporals A. R. J. Goodey and J. Woodward, Sergt. H. Frew-Jones, Corporals S. Beacham and S. G. Cranstone. (Front row) Corporals E. C. Sheploc, A. Bond, J. Eayrs, R. V. Lawton, H. O'Keith-Ayling, and Art.-Cpl. W. Bowcott.

### MILITARY MOTORISTS AT PLAY.

AMID the horrors of war on all hands comes the news of a cricket match held at Alexandria on Christmas Eve between a team of R.E. despatch riders and one from men of the Royal Naval Armoured Car Division. The former won well—total runs 99 for six wickets, their opponents scoring 94. We have to thank Corporal H. Pughe-Lloyd for the results.

### STAFF MEMBERS ON SERVICE.

WE are pleased to announce that H. D. Teage (late sub-editor on the staff of *The Motor Cycle*), who last spring was appointed instructor on engines at the Royal Aircraft Factory, has now been granted a commission in the R.F.C., and is at present on important work in France.

Other members of the staff of this journal in H.M. Forces are:

Sec.-Lieut. Noel C. Barnes, 4th South Mid. Howitzer Brig. (Editorial Dept.).

Pte. S. Witham, 320th Coy., M.T., A.S.C. (Editorial Dept.).

Pte. T. W. Parker, M.T., A.S.C. (Editorial Dept.).

Sec.-Lieut. H. B. Elliott, M.M.G.S. (Advertisement Dept.).

Sec.-Lieut. A. J. Palmer, M.M.G.S. (Cashier's Dept.).

It may be added that two of the present members of *The Motor Cycle* editorial staff have seen active service in France, and were subsequently discharged owing to ill-health. The remainder have attested under Lord Derby's scheme.

The total number of employees of Messrs. Iliffe and Sons, Ltd., proprietors of *The Motor Cycle*, and allied papers; who have joined the colours since the outbreak of war, is now 144.

Sec.-Lieut. M. A. J. Orde, A.S.C., has been transferred permanently to the R.F.C. Mr. Orde, who was formerly a keen rider of a Rover motor bicycle, has had many thrilling experiences in France as an R.F.C. observer, and once was successful in bringing down a German aeroplane.

An R.E. officer in the Motor Cyclist Section stationed in Macedonia has written home to the effect that he and his comrades in arms had an excellent Christmas dinner of turkey, which was done to a turn in a five gallon petrol drum over two Primus stoves. Evidently the drum must have been very carefully cleaned beforehand, otherwise the flavour of the bird might have been spoiled.

# THE ARRIVAL OF THE 1916 MODEL

# American EXCELSIOR

## BETTER VALUE THAN EVER.

£75 7 H.P.  
3-Speed  
Chain  
Drive.

£75 Kick-  
Starter  
Fitted  
Right-hand  
Side.

The most perfect motor cycle it is now possible to produce. When a better motor cycle is built it will be an Excelsior. The serene consciousness of personal safety, with absolute certainty of troubleless travel, is only one of the pleasures of riding an **X**.

## IMMEDIATE DELIVERY.

*Preliminary Specification from Sole Concessionnaires—*

11, Broad Street, Bloomsbury, London, W.C.

## Military Notes (continued).

## SIX MONTHS' DESPATCH RIDING.

CORPL. HOWARD LANE, one of the original founders and first secretary of the Sutton Coldfield club, was home on leave last week, and we had the pleasure of a few minutes' chat with him on Wednesday. He is attached to an ammunition column which at present is billeted in the same village as the No. 5 Battery, Motor Machine Gun Section. All is well with the famous No. 5, and no casualties have occurred of late, though the men are taking their turns in

Triumph, which, beyond the breakage of the spring fork, has given no trouble. He emphasised the appalling condition of the roads, and said that after the war nobody will complain of trial routes at home.

## DESPATCH RIDERS WITH THE MEDITERRANEAN FORCES.

LANCE - CORPORAL LANGLEY, of the 1/1 R.E., R.M.R., with one of the Mediterranean Expeditionary Forces, in a letter to us received a few days ago, says that he and his comrades are located in a long gully, and have to go up a hill, cut in the cliff, about 500 yards in length. There are a couple of bends, the gradient is very steep, and the mud awful. However, his countershaft Triumph gets up splendidly, but his experiences make him long, like many others, for the good roads of England. Langley has six Triumphs and one Sunbeam under his charge, and all are going well.

## A "COMPOSITE" MOTOR CYCLE BUILT FROM WAR DERELICTS.

## Work of a Reader Behind the Firing Line.

WE hear a good deal of the number of machines "scrapped" on war service, but the letter reproduced herewith provides, we believe, the first instance of another machine being built from the remaining sound parts of "scrapped" ones. Further interest is added to the fact that the composite mount referred to was built behind the firing line in France by an artilleryman during his leisure hours. Needless to say, he is a very keen man, and the whole job reflects credit upon him. His name is E. Moslin (Bomb.), and his description reads as follows:

One way of using up war "scrapped" machines. A composite machine built behind the trenches by Bomb. E. Moslin. (See letter.)

the trenches. At present the sidecars are used very little, but all hope that the time is not far distant when an opportunity will occur of showing the capabilities of the M.M.G.S. in work for which it is specially intended.

Howard Lane looks remarkably well, and apparently thoroughly enjoys his work. He is very pleased with his

Lance-Corporal Langley, R.E., who is with one of the Mediterranean Forces.

"I put this machine together whilst in the firing line. It is composed of three different makes—Douglas, Scott, and F.N., but mostly Douglas. Each of the original machines had been badly hit and burnt by shell fire, and was practically scrap. When I hauled the derelicts to my battery on a two-wheeled truck and told my comrades that I was going to build a complete machine from the ruins it caused much amusement.

"The job was finally finished, less magneto and front fork springs, and these I had to purchase. The machine has now been running continually every day, and a good many nights, for eight months. During this time it has covered a few thousand miles on the rough roads in the war zone.

"The old timing case cover had been burnt away, and was replaced by a wooden one. The upper portion of the crank case is also burnt away, leaving the magneto timing wheel half exposed.

"In place of an h.t. wire I used ordinary single strand telephone wire (copper), and it has answered very well. The footrests were missing, so I made some in the following way: Obtaining an ordinary bicycle crank, and placing it upside down, I passed the pedal end through the slots which are made on a Douglas frame for the gear box to slide in, this being a tight fit. I then passed a bolt through the upper threaded end (or pedal end) to stop it dropping down. I then passed a length of 1/4 in. iron rod through the cotter end, and fixed this by tightening up the cotter pin. The rests were five to six inches from the ground, and very useful on greasy surfaces.

"The handle-bars are ordinary F.N. bars, but are opened out to their full extent; this gives good control on grease. The tyres and tubes were second-hand Dunlops, and after eight months' running are still in good condition.

"The machine is capable of doing a good forty miles an hour. It has been running in all weathers, and never been cleaned, so one can imagine its external condition. I am very proud of it, especially as so far it has not let me down. I may mention that the frame has two nasty cuts in it, which were caused by pieces of shell."

Corporal Howard Lane, formerly a leading light of the Sutton Coldfield A.C., who has seen six months' despatch riding in France.

Dr. A. M. Low, R.F.C., has been promoted from Second-Lieutenant to a Temporary Captain.

## Another $2\frac{3}{4}$ h.p. Four-stroke Lightweight.

The Latest O.K. Junior with Overhead Inlet Valve.

**I**N our description, on January 6th, of the O.K. Junior lightweights we mentioned, but did not describe, the new Mark VI., which may be called the *modèle de luxe* of the O.K. factory. The engine has a bore and stroke of  $64 \times 77$  mm., which brings it into the 250 c.c. class, the exact capacity being 248 c.c. The bearings are unusually large, and, consequently, the engine should wear well and give no trouble; the valves also are as large as those found in a 5 h.p. twin. The overhead inlet valve mechanism is entirely enclosed, and requires but occasional lubrication.

The gear box provides two speeds on the dog clutch principle, an ample lubricator is placed on the top of the box, and the controlling lever is provided with springs so placed that it is impossible for the lever to slip out of engagement. The transmission consists of a chain to the gear box and belt to the rear wheel.

The rear brake is applied to the belt rim and operated by the left foot. The lever is placed above the footboard in such a manner that it can be applied without removing the heel from the footboard. This makes it possible to apply the brake with great smoothness.

The neat-looking  $2\frac{3}{4}$  h.p. four-stroke O.K., which has the customary combined chain and belt drive. A two-speed countershaft gear is fitted.

The tank has a capacity of one gallon of petrol and one quart of oil, and is provided with large and high filler caps and a syphon drip feed, controlled by a Best and Lloyd sight feed to carry lubricant to the engine. The frame dimen-

sions are as follow: Height of saddle, 30in. to 31in.; clearance,  $6\frac{1}{2}$ in.; wheelbase, 51in. The tyres are Clincher de luxe, 26in.  $\times$  2in. An Amac carburetter and E.I.C. magneto are standard fittings on this machine.

## Petrol—Price and Supply.

How the Value has Gone Down and the Retail Price Increased.

**T**HIS subject is dealt with in a leading article. Recently we have suffered another rise in the price of petrol, which now, with the additional tax of 3d., costs 6d. more

than it did a few months ago. Moreover, last week the importers of Shell petrol announced that, owing to the large quantities which they were supplying to the Allies for military purposes,

there was likely to be a difficulty in meeting the requirements of private owners unless they could largely curtail their demands. Fortunately, this is not so serious for motor cyclists, who can travel upwards of 100 miles on a gallon of petrol, as for car owners, whose mileage is often in the neighbourhood of 20 m.p.g., but it is quite serious enough. Up to the time of writing the vendors of Pratt's spirit have not announced any probable scarcity, nor should there be any further rise in price. There is a movement on foot to limit the retail price. Meanwhile private owners should limit their requirements to a minimum and refrain as far as possible from driving simply for pleasure.

A careful study of the Board of Trade returns shows no reason for higher prices or any shortage, so that an explanation must be sought elsewhere. Nearly half as much again was imported in 1915 as in 1913, and this, we imagine, cannot include the petrol used at the Front, which goes straight to France. Comparing the totals and the value for the last three years gives the following figures:

	Gallons.	Value.	per gall.	Retail.
1913. ..	100,858,017	£3,803,397	9.05d.	1s. 8d.
1914. ..	119,030,155	£4,301,865	8.67d.	1s. 9d.
1915. ..	144,939,700	£5,262,547	8.71d.	2s. 2d.

This shows the wholesale price per gallon to be less than in 1913, when the retail price was 1s. 8d., compared with the present price of 2s. 2d.

THE UNITED KINGDOM IN FRANCE.

Reading from left to right the four riders shown are of Scotch, English, Irish, and Welsh nationality, a background being afforded by a number of French and Belgian soldiers. We have to thank the Welshman, Lance-Corporal Allen S. Jones, for the photograph. Jones competed in two Tourist Trophy races, and his doings in the war were referred to in our last issue.

## A Motor Cyclist Territorial in India.

Impressions Gained after a Year Overseas.

FROM a long letter from Corporal A. Dendy, now with a Territorial regiment in India, we have been able to gain some instructive information regarding motor cycling matters, both from a peace and war point of view, in parts of India.

Corporal Dendy's regiment reached Cawnpore early last December. At Cawnpore, he tells us, the motor cycles most in evidence are Triumphs, Ridges, Douglasses, Enfields, Rovers, Zeniths, B.S.A.'s, and Indians, and he came across an old Midget Bi-car, which on the level roads surrounding Cawnpore pulls a sidecar well. There appears to be no trouble from overheating, despite the high temperature, but the average machine is not kept in the good tune one is accustomed to note at home. This, Dendy considers, may be due to the fact that there are no hills around Cawnpore, and consequently local riders do not bother about keeping their engines up to concert pitch. Perhaps also the heat does not encourage tinkering with a machine until it is absolutely necessary.

There are many level crossings in the district, and Dendy saw several machines the owners of which had evidently tried conclusions with the crossing gates.

### The Himalayas not the Place for Motoring.

Three months of the summer were spent at Darjeeling, in the Himalayas. The scenery here, needless to say, is grand beyond all measure. From a place known as Tiger Hill, twelve miles from Darjeeling, Mount Everest is visible, though 105 miles away. One has to go overnight to get a view of Mount Everest at day-break, owing to the clouds rising from the valleys in the early morning. During his three months' stay Dendy only saw a couple of machines—a Douglas and a four-cylinder F.N. sidecar—and this scarcity is not difficult to account for, as the only good road in the vicinity is that from Lebong to Darjeeling—a distance of 4½ miles.

On leaving Cawnpore, Corporal Dendy proceeded with his regiment to Nowshera, on the N.W. frontier, to relieve regulars from garrison duty. The headquarters of the No. 1 Mechanical Transport are situated at Nowshera, and upon arrival volunteer car drivers and mechanics were asked for, and Dendy found himself driving a lorry. The convoy consisted of a mixed fleet, and after a month of overhauling it was ordered to Peshawar to carry supplies from there to a camp

fifteen miles away. There were three Triumphs, two 6 h.p. New Hudsons, and one 6 h.p. Abingdon King Dick at the M.T. headquarters, and one of the New Hudsons was attached to Dendy's convoy.

### Many Road Obstructions.

The roads apparently are in a fair condition, though the dust is terrible. Motoring is not all honey, as in addition to the dust there are camel teams, bullock carts, mule carts, and stray dogs and chickens. The camels are the worst offenders, as there is only one man to every four, and they break their ropes, shed their loads, and are off. It may be just as well to add that these conditions do not apply throughout India, but prevail in the Peshawar district, and doubtless the extra military activity due to the war has much to do with it. Many of the officers of regiments stationed out there use motor cycles, and Dendy saw a few Triumphs and one Indian.

### A "Blind" through the Khyber Pass.

At intervals the convoy goes through the famous Khyber Pass to Lundi Khotal fort, a distance of over thirty miles. There are some tempting stretches of road on this route, so tempting, in fact, that, when Dendy was acting as relief driver, he persuaded the motor cyclist to change places with him so that he could enjoy a "blind" on the New Hudson.

Corporal Dendy concludes one of the most interesting letters we have ever received from Overseas with the statement that white metal bearings are a failure in India, judging by the fact that six have gone in six weeks, and on different types of lorry engines.

From *The Edinburgh Evening News*, December 23rd, "Musical Instruments: Triumph, 3½ h.p., 1909, Brampton gear, splendid order, new belt, lamp, good tyres; £21." This seems bad enough, but the next advertisement underneath

is headed "Tuning and Repairing." Thus encouraged, we read further on, only to find that this refers to pianos and organs. Perhaps the person responsible was thinking of tuning his own Triumph when he permitted the motor cycle advertisement to appear under musical instruments.

MOTOR CYCLING IN MALTA.

There are a number of motor cycles and sidecars in Malta, and our illustrations show a fine 7 h.p. four-cylinder F.N. passenger machine (with Speedwell sidecar) owned by Mr. A. Cochia Zammit, of Zeitun, Malta, who is shown driving. The owner reports that it has given very satisfactory service.

## Sidecars and Accessories Next Week.

The latest in sidecar attachments and accessories of all kinds will be reviewed and illustrated in the next issue of *The Motor Cycle*.

## Royalty and the Motor Cycle.

A year ago a Sunday paper told a cock-and-bull story about the Prince of Wales and a motor bicycle he never rode. Now a weekly paper tells us that Prince Henry is a convert to the best of pastimes, though he is not yet allowed the freedom of the roads, and does not show Prince Albert's enthusiasm for mechanics. We trust that the rumour is true, as it would indeed be gratifying to know officially that motor cycling is a pastime of the sons of kings. That it should be so is only what it deserves to be. Here's to it! There is nothing like it!

## The Coventry Motor Machine Gun Battery.

H. Hegan and S. Hathaway, who were in the first motor machine gun battery recruited by the Editor in November, 1914—the No. 5—have been granted commissions. Sergeant-Major Palmer, of the same battery, received his commission some weeks ago. Sergt. W. A. Davenport, who has been ill for several months, is, we are glad to say, quite well again. He called on us last week and reported that he was joining an A.S.C. company.

## Sutton Coldfield Club to Carry On.

Mr. James St. John informs us that there is no intention of closing up the Sutton Coldfield and Mid-Warwickshire A.C., but no competitions will be held while the war is on. For last year only members not on active service were called upon for subscriptions, and none will be asked for this year. If, however, any member desires to continue membership of the A.C.U. he must send his affiliation fee direct to the A.C.U. secretary.

Members of the Sutton Coldfield Club have given a trailer ambulance to the Birmingham Red Cross authorities, and the necessary amount for the purchase of a second one is nearly complete.

## Light Dimming Discs.

The Automobile Association and Motor Union has arranged for the manufacture of a lamp disc for use by motorists when entering the areas where the new Order, which came into operation on Monday week, renders the use of such discs compulsory. Members who require these discs should communicate (stating the diameter of the front glass) with the Secretary, Fanum House, Whitcomb Street, London, W.C.

## A Case of a Choked Petrol Feed.

The other day when we were trying a totally new and strange machine, the symptoms that the petrol feed was obstructed were soon experienced. This happened as soon as we opened the throttle, and the machine would cease firing after a very few seconds' running. The float chamber was found to be almost empty, and filled again extremely slowly. The machine would then run quite well for a short distance and stop again. Comparatively slow progress was made for two or three miles, and when an opportunity presented itself the matter was investigated. The petrol tap was provided with a sump lined with gauze. Before this could be removed all the petrol had to be emptied out of the tank, and on the gauze being examined it was found that practically the whole of the orifice was covered by a flat piece of solder, and there also remained therein a piece of soap and several pieces of solder, so that the fuel had small chance of reaching the carburettor at all. The matter was, of course, caused by arrant carelessness on the part of the tank makers, but such trouble is much too frequently experienced by motor cyclists.

## The Public Schools M.C.C.

The Public Schools Motor Cycling Club, like many others, has suspended all activities during the period of the war. Many of its members, and most of the committee, are now serving their country, while two of the latter have, sad to relate, lost their lives at the Front. The secretary, Clive Preen, is an R.A.C. car driver attached to the R.E.'s stationed in Essex, in whose service he has already worn out two motor cars and is now in need of another. W. Tallboys Getting is unfortunately among the missing, and was never heard of after crossing Fosse 8. R. L. Keller, who is serving with a Warwickshire artillery battery, was recently mentioned in despatches. P. C. D. Douglas, just before war broke out, met with a very serious accident, and badly injured his leg. He tried to pass the doctor by all manner of ruses, but was unsuccessful, so he bought a car, became an R.A.C. driver, and did much valuable work. Later he obtained a commission.

MOTOR CYCLING THROUGH THE FLOODS.

Miss Leila Wallis, of Hereford, driving a Norton sidecar outfit through a flooded Herefordshire road. The machine, we are told, came through water up to the hubs without a misfire.

**Sidecars and Accessories.**

Next Thursday, the 27th inst., a special number of *The Motor Cycle* dealing with the above subjects will be published. It will be divided into four sections.

**From an American Contemporary.**

"Whatever tests the seasons send  
Sidecar pleasures never end."

**Spring Frames.**

Our spring frame campaign has now extended to the very ends of the earth, and it is discussed in motor cycling topics of journals published in far-off lands. A design which appears in our letters pages this week comes from Mudros, one of the scenes of the ill-starred Dardanelles operations.

**Average Prices.**

We give below the average prices of second-hand models offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model the average for the past week is quoted. If there were not at least two advertisements, then the last occasion on which they were quoted is given.

**Recruits from Toronto.**

Many well-known Toronto riders have enlisted as despatch riders in various Canadian Corps, and we hear that a dozen more have recently joined the A.S.C., M.T. (British Service), a recruiting branch of which has been opened in Toronto.

**Aero Engines on Motor Cycles.**

Referring to our articles on the subject of aero engines and the influence they might exercise on motor cycle construction, a correspondent tells us that he once saw a Gnome engine fitted to a motor cycle. This was placed in the usual position in the centre of the frame, and was said to develop enormous power, so that steep hills could be taken with the utmost ease. The only drawback was, we are informed, the continuous hum of the exhaust.

**A CASE OF TUNE!**

Miss Florence Eyre, the well-known Covent Garden soprano, on her Royal Ruby two-stroke. This is an instance where rider as well as machine must always be up to concert pitch!

**Motor Cyclists' "Through Routes."**

In connection with the new edition of "The Motor Cycle Route Book," which is now in course of preparation, we invite the co-operation of a number of our readers in ensuring that the routes recommended shall be the best from a motor cyclist's point of view. Various correspondents throughout the country are collaborating in this new edition, but there are certain districts in which we would welcome our readers' advice. Those who have extensive knowledge of the roads in the undermentioned districts would oblige by communicating with the Editor, marking their letters "Route Book," when proofs of the book will be submitted for criticism: (1) East Anglia, (2) North-Eastern Counties, (3) the country south-west of a line drawn from Bristol-Exeter-Lyme Regis, (4) Scotland—north-east and north-west of Aberdeen, and (5) South Wales.

Captains Smith and Davidson and Lieutenant Cadman come in the list we recently published of those mentioned in despatches.

**The Game of Cribbage.**

We are sorry to have caused inconvenience to those journals which copied—without acknowledgment—the erroneous report of the death of Flight-Lieut. Wilberforce. After all, that is one of the risks of piracy.

**1,000 Miles in 1,000 Minutes.**

An American rider, Arthur Chapple, proposes to make an attempt to cover 1,000 miles in 1,000 consecutive minutes (16½ hours) on the new Sheepshead (New York) track. The machine to be ridden is not yet decided upon.

**United States Military Riders.**

As a preliminary step, the U.S.A. Congress has been asked to provide 100 motor cycles for the use of the Army Signal Corps. General Scriven, chief of the Signal Corps, says that his experience has indicated the great value of motor cycle riders in his particular branch.

**A Long Distance Road Record.**

According to a Reuter telegram a few days ago, Erwin Baker, an American rider, covered 930 miles on a motor cycle in twenty-four hours at Melbourne, Australia. Baker left San Francisco a couple of months ago with one of the latest Indians, with the intention of securing all the Australian records he could. He has evidently made a good start.

**Military Cross for Captain Little.**

Captain W. B. Little, 151st Brigade, 60th Division, was mentioned in Sir John French's recent despatch. Captain Little, who is an expert in horticulture and a well-known motor cyclist, is a native of Carlisle. His name appears in last week's list of officers who have been awarded the Military Cross.

**Daily Motor Cycle Exports.**

The average daily exports of motor cycles in 1915 amounted to 30.08. Imports of foreign machines averaged 12.44 per day. The exports could be very greatly augmented if better transport facilities were provided. Why not a little less cocoa and coffee for Germany?

**The National War Funds.**

At the week-end the principal war funds stood as follow:

The Prince of Wales's National Relief Fund	(£2,893,000 distributed)	£25,714,879	0	0
Fund for the Sick and Wounded		3,132,687	0	0
The Queen's Work for Women Fund		168,104	2	3
The Belgian Relief Fund (exceeds)		1,300,000	0	0

**Rewards for Service in the Field.**

In the list of rewards for service in the field we note the following names: Distinguished Service Order, Temporary Major C. H. T. Byng Hall, M.M.G.S., and Captain A. H. Davidson, R.E.; the Military Cross, Temporary Captain C. M. Smith, Intelligence Corps, Captain H. Blackburn, R.F.C., Temporary Lieutenant E. W. Bennett, M.M.G.S., Temporary Lieutenant Guy Campbell, M.M.G.S., and Temporary Second-Lieutenant C. J. Cadman, R.E., Motor Cyclist Section (S.R.); Distinguished Conduct Medal, Lance-Corporal (Motor Cyclist) C. C. Parrott, Home Counties Field Co. R.E., T.F., and Battery Sergeant-Major B. Stichbury, No. 4 Battery, M.M.G.S.

## NEW RECRUITING SCHEME.

10,000 Men for R.F.C.

TEN thousand men are wanted for the Royal Flying Corps as quickly as possible. The system of recruiting is very smartly arranged. An R.F.C. party, consisting of an officer, trade-testing N.C.O.'s and men, with clerical staff, are being stationed in various centres, and men will be tested there and then, and finally approved, lorries, lathes, and such like being included in the party's equipment specially to test the recruits. All Flying Corps tradesmen are required, but particularly fitters, motor transport drivers, instrument repairers, coppersmiths, and storemen (with knowledge of engine parts). The pay in each case is 2s. per day.

The South Midland R.F.C. party will be stationed at Birmingham from to-day (Thursday) until further notice. Further particulars may be obtained from local Recruiting Offices, but it should be noted that Groups 2 to 5, which are being called up this week, are debarred.

## A DOUBLE SIDECAR OUTFIT.

THERE was recently held in Durban, Natal, a Joy-ride Day, in aid of the Overseas Fund, which was organised by the Natal M.C.C. It was a great success, and over £40 was collected by some twenty sidecar outfits. The idea of the double sidecar illustrated caught the public's fancy, and it was in demand all day long. Two sidecars, it will be noticed, are fitted to a 7 h.p. Indian. This is no novelty, since as long ago as in the issue of July 8th, 1903, on page 320, we published a photograph of a 2½ h.p. Excelsior motor bicycle to which two Millford sidecars were attached in a similar manner.

An Indian double sidecar outfit used by Mr. R. A. Jordan, of Williams, Hunt, and Co., of Durban. The combination took part in the Durban Joy-ride Day, by means of which a considerable amount was added to the local war funds.

## SUCCESSFUL COMPETITORS IN A NEW ZEALAND TRIAL.

F. Drake (3½ h.p. New Hudson) and S. Medder (3½ h.p. New Hudson sidecar), who won their respective classes in the 260 miles trial from Dunedin to Timaru and return on October 29th last. Medder put up the best all-round performance of the day.

## HOLLAND AND AMERICAN MANUFACTURERS.

AS showing the manner in which United States motor cycle manufacturers are obtaining the cream of the Dutch trade now that British machines are practically unobtainable, the following extract from an article in a recent issue of our Chicago contemporary, *Motor Cycling and Bicycling*, is interesting. The article is written from The Hague, and the following is the most interesting extract:

"Yesterday I had a chat with one of the leading motor cycle and bicycle dealers of the city, and as a matter of course the conversation soon came on

the situation of the motor cycle and bicycle trade in Holland during the war. My man complained bitterly. He told me he could not get the goods he wanted. Before the war he imported a lot of stuff from England, such as bicycles and many other sporting articles. Now he could not get hardly anything he wanted. As a matter of course the bicycle export, and at the same time the motor cycle export, from Great Britain to Holland had completely come to a standstill on account of the war. 'You know,' he said, 'I have no difficulty in selling the goods when I have them, but the big point is in the trouble of getting them.'

"As to the motor cycles, this is not so serious, because the United States are exporting lots of motor cycles to Holland. At present Harley-Davidsons, Indians, Hendersons, and other well-known American motor cycles sell like bread here, and it seems that the Dutch public likes these American makes very well. Before the war we imported English motor cycles, such as the Douglas, or Belgian ones, such as the well-known F.N., but this is out of the question now."

In this connection it is interesting to record that the Dutch Government not long ago placed an order for fifty W.D. pattern 2½ h.p. Douglases.

## FROM A.C.U. TO R.A.M.C.

WE have lately heard from Private F. J. Briggs, R.A.M.C., who until the beginning of the war was a clerk in the competition department of the A.C.U. Writing from France, he says: "I have had the good fortune to ride a Rudge-Multi for a month or so, and can assure you that I thoroughly enjoyed a return to the sport which I like so well. Despatch riding out here is good training for trial work. I can assure you. My best good wishes to the M.M.G.S. I only wish I were among them."

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### A Magneto Query.

(1.) I have put coiled copper wire round my cylinder to assist in cooling. The wire almost touches the magnets of the magneto. Will this harm the magneto in any way? (2.) I have a three-speed hub gear. Can I convert the machine into a chain and belt drive by fitting anything, as the pulley is rather small for direct belt drive? (3.) Can I fit 26in. x 2½in. tyres on 26in. x 2in. rims?—S.P.T.

(1.) This will do the magneto no harm. (2.) We think it would be difficult to convert the machine into chain-cum-belt drive. It would necessitate mounting a countershaft on the bottom bracket. (3.) You can fit 2½in. tyres on 2in. rims.

### Too High a Gear.

(1.) I have a 1915 5 h.p. Indian. It used to do about 50 m.p.h. on the top gear and about 40-45 m.p.h. on the middle. I have now fitted on to it the standard Indian sidecar. With a fairly heavy passenger and on the level I can get 40 m.p.h. on the middle gear and about the same on the top. The engine generally knocks on the top gear. I am told that the gear ratio is too high. The present ratio is 12, 7, and 4½ to 1. Now, if I get it changed to 5 to 1 on top by putting on a bigger wheel and sprocket I am sure it will remedy the defect. (2.) On no account can I drive the machine at less than 20 m.p.h. on the middle gear even. I have always to use the clutch and brake to hold the machine back. (3.) I can do no more than seventy-five miles on a quart of lubricating oil. This is, too low. What should be the correct figure for ordinary running?—M.R.S

(1.) It is evident that your machine is geared too high on top gear, and you will do much better all round by gearing about 5 to 1. (2.) The 5 h.p. twin does not as a rule run quite so slowly as the 7 h.p. You might try reducing the size of the pilot jet. If this does not have the desired result you might try the tip suggested in *The Motor Cycle* of December 9th, page 591, in which it is suggested that a tap be fitted in the small pipe between the pilot jet and induction pipe. By this means it is said to be possible to throttle the machine down to a crawl. (3.) You should be able to cover about 100 miles to a quart of lubricating oil.

### Coasting in Neutral.

I have a 1915 2½ h.p. two-stroke motor cycle fitted with a two-speed countershaft gear. (1.) Can I use the neutral gear for coasting down hills, provided the throttle has been closed? (2.) Will the engine run freely in neutral? (3.) Is it advisable to give the engine a pumpful of oil on starting up from cold or simply allow the drip to work, as the exhaust smokes for some little while on starting after giving a full pump?—B.G.B.

(1.) You may use the neutral gear for coasting, but we should not recommend you to make a habit of doing this, as it is sometimes difficult to get the gear into engagement again. (2.) The engine certainly runs freely in neutral, but, of course, a gear of this kind cannot be made use of for starting the machine from standstill. (3.) If you have reason to suppose that there is not sufficient oil in the engine you may give it a pumpful before starting. The fact that the exhaust smokes seems to indicate that there is rather too much oil in the engine.

## NEXT THURSDAY!

### Sidecars and Accessories.

### Magneto Parts.

Will you please let me know (1) the object of the small carbon brush at the back of the "make and break" of my Bosch magneto, as it does not seem to make much difference whether it is in place or not? Also (2), is the small flat spring that presses the pivot of the rocker arm merely to keep the rocker arm in its proper position?—L.L.

(1.) The small carbon brush to which you refer is the condenser connection, and, while the magneto will still continue to spark if this brush is removed, if it is removed there is violent sparking at the contact breaker points, causing rapid pitting of the platinum. (2.) Yes, the small spring referred to is simply to keep the rocker arm in position.

### Firing on One Cylinder.

I am thinking of buying a motor cycle second-hand. The machine in question is a 1913 5-6 h.p. Indian, overhead valves and automatic carburettor. Only one cylinder (the rear) fires until a speed of 30 m.p.h. is attained on the top gear, but when on the stand and a bit warm both cylinders will fire. The valve timing is correct and the contact points open at the right time. The pistons and bushes are in good order, and no leaks in the carburettor.—W.B.

The fact that the machine will only fire on one cylinder need not necessarily be a serious fault; it is far more likely to be due to some simple cause. The timing is easily tested, and if it fires all right on one cylinder it is not likely that the timing is wrong. However, you might test it. The exhaust valve of each cylinder should close directly the piston reaches the top of its stroke. If this is correct in both cylinders the other valve timings will also be automatically correct. The contact breaker points should separate when the piston is on top, with the ignition half advanced. The most likely cause of the machine not firing on one cylinder is that there is an air leak in the induction pipe between the carburettor and engine. Try hindling all joints with adhesive tape. Also fit a new plug.

### A High Compression.

I have a 3½ h.p. 1910 single-cylinder, and after running a few miles at a fair pace it is very inclined to knock, unless I frequently remove the cylinder and clean the carbon deposit from the cylinder head and piston. Otherwise the machine runs well and is very fast. I have been told this is due to too high compression. If this is so, how can I best remove the trouble?—A.H.

It is very possible that the trouble is caused by a high compression. There are several ways of overcoming it: (1) By inserting valve caps which have been turned hollow on the inside; (2) by fitting a washer ¼ in. to ⅜ in. thick under the cylinder, taking up the extra clearance between the valve tappets, if not adjustable, by means of tappet adjusters. A piston which is slightly shorter from top to gudgeon pin centre would also have the same effect.

**SPECIAL NOTICE.**—Copies of "The Motor Cycle" may only be sent to neutral European countries if posted direct from the offices of the publishers, or by newsgents who have obtained permission from the War Office for this purpose. The publishers of "The Motor Cycle" have obtained the necessary permission, and, consequently, can send subscribers' copies as usual. Before sending through newsgents it is important to enquire if permission has been obtained, as otherwise copies intended for neutral European countries will not be forwarded by the Post Office.

## Noise in Engine.

I have had my mount—a 2½ h.p. two-stroke—just twelve months, and up to a fortnight ago I have experienced no engine trouble whatever, although I did a good five hundred mile tour last August. About three weeks ago a bolt came loose in the magneto end of the magneto chain, and naturally the timing was altered and I came to a standstill. I had the timing adjusted, but since then the engine has developed a peculiar grating and knocking. I took the engine down, and had the big end seen to and tightened up, but this grating noise is now worse than ever. I have also noticed that petrol drips out of the tap under the crank case, which indicates, of course, that the petrol must be getting down between the piston and cylinder. I should be extremely pleased if you would inform me of the cause of the knocking or grating noise; how to effect a cure; and how to stop the petrol from getting between the cylinder and piston.

—D.C.B.

It is very difficult to say what is the cause of the grating in your machine, but as it developed after the timing slipped it rather points to the fact that the timing has been reset in the wrong position, probably too far advanced, causing knocking. It is curious that you should get petrol in the crank case; it would seem as though the carburetter is flooding, and so admitting pure petrol to the engine instead of petrol vapour. You should make sure your carburetter is in good order and not flooding. If petrol is so prevalent in the crank case it is possible that this is the cause of the grating, owing to it impoverishing the lubricating oil, and you should try and find out where it comes from; it is not likely that it passes the piston. Make sure the piston and cylinder are free from carbon deposit, and that the top piston ring is not stuck in its groove. Also make sure the bolt that became loose is not projecting too far and rubbing against the casing.

## READERS' REPLIES.

## Magneto Lighting Set.

In the issue of *The Motor Cycle* for December 23rd, I notice "C.G.C.," on page 643, is having trouble with his Dynalite lighting system. Perhaps my experience of a similar system, namely, the Voltalite, may be of use to him. Since the beginning of October I have used electric light every morning and evening going and returning from my work, and have not been troubled by a bulb fusing, even at 40-45 m.p.h., which speed should satisfy most people in the dark. As is rightly stated in the reply, a higher voltage lamp would remedy the trouble, and a poorer light would be obtained at slow speeds, yet even this can be removed as follows: I make the dynamo run the rear light as well as the head light, and connect two low voltage lamps in series for this purpose. I find two 3.5 bulbs in series are very suitable, as the voltage required to light these effectively is  $3.5 \times 2 = 7$  volts, which is about the voltage given by the dynamo. Then at slow speeds, by means of a handle-bar switch, I "short" the rear

light, thus putting the efforts of the dynamo entirely through the head light. I append a sketch of the simplest wiring. If both lamps have one terminal "earthed," then one lamp can easily be

Wiring diagram to illustrate reply from W. U. Dykes, published on this page.

insulated from the frame. I have the head light insulated from the frame. The earth terminal of the dynamo is just screwed to the outer casing, and does not require to be used. Thus only three wires are used—one from the dynamo to the head light, the head light to the tail light, and the switch wire. Twisting the wire into a spiral before attaching to the terminal will make the connection infinitely more durable.—W. U. DYKES.

## Loss of Power.

The question asked by "H.J.M." in *The Motor Cycle* of January 6th reminds me of a similar experience with my 6 h.p. Royal Enfield some six months back. Every working part seemed to be in excellent going order, but the running was listless and dead. Full throttle, spark retarded, and low gear would give temporary relief, postponing for a moment the inevitable full-stop. Starting was extremely exhausting, as until I was tired out I got nothing but a sequence of half-a-dozen

explosions, a grunt or two, and then silence. I could find nothing wrong with the machinery anywhere, simply because nothing was wrong, but as I had removed almost every available nut I included the waste oil cap, and here lay the cause of the trouble. The machine had exhibited no sign of over-oiling, shown no smoke at the silencer, nor did it blow oil about, yet after letting out this oil a miracle seemed to have given life and power to the machine. Three times has my machine shown these symptoms—and the remedy has acted like magic.—H.A.H.

## EXPERIENCES WANTED.

"J.G." (Northants).—Revere. Reliability, efficiency, and speed.

"R.J.H." (Walsall).—Dalm. Speed, hill-climbing, reliability, consumption, and ease of starting.

"Persevera" (Liverpool) and "E.K." (Bradford).—Grado pulley for sidecar,

## RECOMMENDED ROUTE.

GILLINGHAM (KENT) TO NEWCASTLE-ON-TYNE.—F.R.B.

Gillingham, Gravesend, ferry across Thames to Tilbury, Ingrave, Brentwood, Chipping Ongar, Harlow, Bishops Stortford, Newport, Cambridge, Godmanchester, Huntingdon, Stilton, Stamford, Grant-ham, Newark, Tuxford, East Retford, Bawtry, Doncaster, Wentbridge, Ferry-bridge, Aberford, Wetherby, Borough-bridge, Leeming, Catterick, Scotch Corner, Barton, Darlington, Ferryhill, Croxdale Station, Farewell Hall, Neville's Cross, Chester-le-Street, Gateshead, Newcastle. Approximately 300 miles.

## A SIDECAR TO THE RESCUE.

A sidecar towing a broken down light lorry carrying 5 cwt. of goods and five men. The machine is a single-cylinder 4½ h.p. Excelsior.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

#### The Pay of Army Motor Cyclists and Car Drivers.

Sir,—I have just seen your article in *The Motor Cycle*. Now, I am a 6s. a day man, and enlisted on October 13th, 1914, and on October 17th, 1914, was on the way to France, as I was an expert driver, and I can tell you, from experience, there are no soft jobs out there. I earned all I got.

Now, what I do not hold with is this, and it is time something was done. I came home wounded on June 3rd, 1915, and was in hospital till I went to Aldershot on August 6th, 1915. I am now marked unfit (I have defective eyesight) and have been drawing my 6s. a day since for nothing. That is where the money is wasted. Also in this camp there are others who have done nothing since August.

Lark Hill.

S.T.C.

#### The Lighting Regulations.

Sir,—Now that the new lighting regulations are in force there are many complaints to make. About three months ago most people were grumbling about the various local requirements, and they asked the Home Office to make some general order. The Home Office has made an order, but it is far from perfect.

The drivers of our (M.M.G.S.) cars are fairly active on their feet, and I am certain they will be more active very soon, as on the way from Bisley to Brighton, or any place you like to mention, so many changes in discs and paper have to be made. I was pulled up the other day by a village constable, who said my lights were too bright. The car I was driving was a Studebaker, and I had three coats of white paint on the glass, and I could have seen better with a match than with the "lights" I was using.

Another question to be raised is, how can the police prevent us from brightening our lights when we are out of the towns? The police in this part of the country (Surrey) are very down on the military, but, speaking from what generally occurs, they are often "strafed" in their efforts.

H.J.C.

#### British Machines for British Riders.

Sir,—After reading the letter from W. Cartwright it was a welcome change to turn to the letter from "Penrot" and find there was still some patriotism left in England, for one is inclined to doubt it when reading Mr. C.'s letter. Does that gentleman know the first thing about national economy? Apart from that it augurs ill for your policy of patronising British trade after the war, when such sentiments are expressed when our nation is in the hour of her agony. I suppose Mr. C. would buy a German cycle if he could get one for £60, then make the excuse that "the poor German is not so bad as he is painted, and we must have the cheapest article." The very creed that has almost damned this country!

Pardon my heat, sir, but if Mr. C. had worked with me for the last sixteen months among the wounded and dying he would have found that there are still some men (working men) left who value their country more than a paltry £10 or so, and have proved how they value it by what they have given for it. My best thanks to "Penrot" and "Cuckoo" for sentiments expressed.

CORPORAL (R.A.M.C.).

Sir,—I notice a letter in *The Motor Cycle* of January 13th from "Penrot." He has my sentiments down to the ground. It has taken this war to make the British public see straight.

I think we are beginning to see that Free Trade is not always for our good, seeing we have now a 6s. 8d. per £1 tax on imported machines, and imposed by a Liberal Government. The British public and British manufacturers must see that other Continental countries do not get the trade before it is too late. A NINE YEARS' READER.

Sir,—"Penrot's" patriotic prattle evidently comes direct from the heart. Sentiment is very nice, and it is fine to soar away far up into the blue ether, but we must always return to the common facts of earth.

I am a buyer of a high-powered twin sidecar combination, and, after due consideration, I have ordered a Yankee outfit. In doing so I consider I am performing a fine service to my country for the following reasons: Firstly, the British manufacturer does not want my order; he has as much work on hand for the Government as he can manage. Secondly, he cannot take my order without taking men off Government work to deal with it. Thirdly, when buying a foreign machine, 6s. 8d. in every £1 goes direct into the British Exchequer. If the order were placed with a British firm the Exchequer would only receive the income tax on the net profit—an amount, probably, only one-tenth of the Customs import duty on my machine. WOTS WRIGHT.

#### A Tip for Hub Gear Users.

Sir,—We notice in your issue of December 30th, 1915, a most interesting account of the journey into Kashmir on a motor cycle fitted with a Sturmey-Archer gear, over the initials "C.A.T."

We see that your correspondent had the misfortune to break off the adjustable gear rod, and was apparently under the impression that this rendered his gear useless as regards the second and top gears.

A useful tip under such circumstances would be to wedge up the bell crank lever at the left-hand end of the axle with anything convenient, such as a chip of wood. This may be quite easily removed when necessary to drop into low gear, and should therefore occasion very little delay in arriving at a place where a permanent repair was possible.

In the hope that this tip may reach your correspondent, and be useful to him as well as to other riders of Sturmey-Archer gears.

STURMEY-ARCHER GEARS, LTD.

#### Despatch Riders and the Groups.

Sir,—Being a regular reader of your very interesting paper, and seeing a note in your issue for December 30th concerning the recruiting for despatch riders in the R.E., I thought I would write you *re* the above.

I offered my services some time ago, and was instructed to report at Bedford to undergo the proficiency tests. This I did at considerable expense to myself, and after passing the tests I was informed that I should be called up in a few days. A few days later I received notice telling me I should not be required until the beginning of January. This was in November, and on December 30th I received a postcard as follows: "Instructions have just been received that candidates for the Motor Cycle Section of the E.A. area cannot now be accepted for the month of January until further orders."

This, to me, seems very unsatisfactory. Of course, I am content to wait my turn, but having attested under Lord

Derby's scheme, I am wondering what consideration I and many other motor cyclists on the various waiting lists will receive when called upon to report with the groups. It seems very unfair that men who have offered their services quite voluntarily for a branch of the Service in which they feel they will be able to do most for their country, and who have in many cases gone to considerable expense to show their proficiency, should be obliged to enlist in something entirely different. I think I shall be quite right in assuming that there will be a good demand for D.R.'s later on even if there is no demand now.

I am sorry to trouble you with such a long letter, but think I am expressing the feelings of many fellow motor cyclists on the various waiting lists.

C. LARWOOD.

[We refer our correspondent to page 38 of our last issue.—Ed.]

### Footrests v. Footboards.

Sir,—I notice "Ixion" expresses his preference for footrests to footboards. I wish to venture the opposite opinion, both on the grounds of comfort and protection for the engine in case of accident. I have removed the footrests and pedalling gear from my machine, and replaced them with a pair of long footboards. I did this because I found that my legs became stiff and cramped after a long ride, owing to their being kept in one position. Also when I had a spill invariably one of the footrests was broken off, and on one occasion the exhaust valve lifting gear was "rubbed off" the crank case also. With the footboards, however, practically no damage results, the most being one of the boards (which are made of wood covered with rubber) being split. This was easily replaced with a piece of wood from a petrol case.

I know this is a matter of personal preference, but I should have footboards every time. The boards I like best on a machine are those on the Douglas and Enfield.

I have been taking in *The Motor Cycle* for about two years now, and am greatly interested in the motor cycle despatch riders' work. There are none wanted in connection with the N.Z. Expeditionary Force or I would have tried to join that branch. As it is I have had to be content with the infantry, and am leaving for the training camp in about a month's time.

J. BURT.

Invercargill, N.Z.

### Two-stroke Lightweights—A Criticism.

Sir,—I have a 1915 lightweight machine (Revere), and was interested in the article on lightweight models in your issue of December 30th. It is true they get splashed and soaked all over in bad weather, but I have ridden this machine during the past few weeks in pouring rain with no trouble or ill-effects. I wash it down like a car each time it is out, and then every bolt and nut and working joint, etc., is scrubbed with Gishurstine with a toothbrush to prevent rust, after first being well dried, and the Gishurstine grease is allowed to remain on. This is very good and effective where wet and rust are concerned.

I find it a particularly smooth-running cycle with a nice even hum, except for a rattle in the engine, which I cannot account for unless it wants cleaning. I keep all parts thoroughly clean outside, but am a novice where mechanical work is concerned.

IGNORAMUS.

Sir,—I should like to endorse "All Weather Rider's" statements *re* mudguarding. My machine is a 1916 two-speed countershaft model. After going through the same experience as "A.W.R.," I decided to fit a flap on the front guards similar to the B.S.A. Since then "I have used no other," and the trouble is completely cured. As regards the coil brakes, I find them quite efficient if used gradually and oiled according to directions. One great source of annoyance to me was the carburetter. It was continually being choked with filings, etc. I took it down about eight times, and now seem to have cured the trouble.

It seems impossible to fix the change gear lever securely for more than two or three days at a time. My petrol consumption is about 90-95 m.p.g.

A.O.G.

Sir,—In 1913 and 1914 a leading firm or two made a departure from what had hitherto been no more than pedal cycle mudguards with side valances by increasing the width of the mudguard, even to making it wider than the forks and adding side wings of considerable extent. This is the best manufacturers have done up to to-day; but a moment's thought will prove it cannot be entirely efficient. Now let us see what happens upon a run in mud. The wheel, upon entering a puddle, violently throws the water and mud upwards and outwards very wide; before it has time to drop the machine and rider run into it. The remedy is a mechanical one, which is not to permit the evil by going straight to the seat of the trouble—the spot where the wheel touches the ground—and trap the mud. Even then there are minor troubles to see to, such as mud blown back from the top of the wheel and mudguard, which the "standard" mudguard and the improved form cannot deal with.

We state that a motor cycle can be made a perfectly clean vehicle, one which can be ridden over all roads at any time of the year and permit the rider to enter a house by the front door with boots clean enough to make the rider a welcome visitor.

Another of your correspondents of the 6th—Sergt. Benfield, R.E., in France—writes: "We have good engines, frames, and wheels," and asks for protection from cold and wet. Evidently the soldier is looked after no better than the civilian; but the civilian has the remedy in his own hands. He has but to select the machine he fancies and let the makers know he buys only if it is fitted with efficient mudguarding.

KUMFURT MOTOR CYCLE & ACCESSORIES CO.

F. WAIGH.

[The exigencies of space have compelled us to delete several paragraphs from the above letter. Correspondents are asked to remember that brevity is a virtue.—Ed.]

### Spring Frame Design.

Sir,—I enclose a sketch which I have made for a new design of spring frame. I have not inserted any details at all, but I believe the principle is clear. I should be glad to have any criticism of it, and to know whether it would be of any practical value. I may say that it is designed for an 8 h.p. twin Campion. I find that with the

pivot arranged according to sketch the change of length of chain is negligible. Of course, only a chain guard could be fitted, not a proper chain case unless it was specially designed for the purpose, but I am an advocate of a semi-exposed rear chain.

I may say that my experience since joining the Army has convinced me that spring frames will become standard on all but lightweight machines.

WALTER LAFFAN (CORPL. R.E.)

B.M.E.F., East Mudros.

[The design appears sound, but is not novel. The method of controlling lateral play seems to be placed in the position where it is least wanted. The rubber buffer should be inside the bend of the spring.—Ed.]

### Some Fads and Fancies.

Sir,—I have read with great interest the article "Some Fads and Fancies" by Captain A. Lindsay, M.B., in your issue of last week, and am very pleased to notice therein his graceful expression of testimony to the satisfaction he has derived from the use of my three-jet carburettors on his different machines.

His criticism of the carburettor levers, in the same article, is also interesting. In this connection I am happy to say that we have recently been able to effect considerable improvement in these fittings, and are now producing a lever which works wonderfully smoothly and in which any tendency towards wire breakages has been eliminated.

Allow me to add that I wish to be untiring in my efforts in the direction of perfection, and that I equally appreciate commendation and criticism coming from such a distinguished amateur and authority as Dr. Lindsay.

C. BINKS, Managing Director.

### Tyre Repairs.

Sir,—With reference to "Road Rider's" article and the replies received by you thereon, we shall be much obliged if you will allow us space to clear up certain points that have arisen.

Respecting the stud itself, the top has been shaped at different angles to suit the various sizes of studs for two particular reasons, viz.:

- (1.) So that when solutioned the whole surface, being equally exposed, can dry properly, and
- (2.) When pressed down it will immediately draw up the inside portion to grip the tube as in a vice, irrespective of the air pressure in the tube itself.

Mustikon studs will stretch equally in all directions with the tube, and always retain the original curve of the tube. In view of the vice grip mentioned above, due to the angle of the top cup, the inside disc must seal the aperture, and in fully 90% of repairs it actually permanently adheres to the inside of the tube, but we would point out that if the puncture is cut to the exact size of the template (neither smaller nor larger) on the base of the stud it is immaterial whether the inside disc adheres or not, as the angle of the top flange is so calculated that directly it is pressed down it takes the curve of the tube and automatically draws the inside disc to the same curve. This (irrespective of the air pressure and the fact that the hole is completely filled by the neck of the stud) absolutely prevents any air from escaping.

It is possible to fit the stud dry, and the air pressure from inside, combined with the pressure of the outer cover on the outer disc, will make an air-proof repair. When pressing down the outer disc it should be done from the centre outwards, when no air can possibly remain between it and the tube.

With reference to the remarks on page 660: Should it be necessary to pass the stud through two or even three thicknesses of rubber, this can be done easily and satisfactorily, the only result being that a small portion of the centre of the top flange is sucked into the hole, but the remainder can be pressed down, forming a perfectly sealed repair. Our own repair department frequently has to pass No. 1 studs through three thicknesses of a stout tube.

"Batite" mentions the outer cover, and in this direction we have several advices from users that they have made repairs with the stud in the outer cover which have successfully carried them home, one user stating that he had travelled as many as 500 miles with a Mustikon stud in the outer cover.

MUSTIKON, LTD.

### Varying the Power of Electric Lights.

Sir,—With reference to the letter by "W.K.O.M." appearing in the issue of December 23rd, although the switch gear he suggests for putting the head lamp and rear lamp bulbs in series or parallel at will is ingenious as such, this method of dimming is only satisfactory where pairs of bulbs of equal candle-power are used, as, for instance, in the case of car head lamps or side lamps.

The reason for this may be found in the fact that the "voltage-drop" through lamps in series (neglecting temperature corrections) is inversely proportional to their candle-power when in their normal position, i.e., in parallel. To take a typical case where a head lamp of four volts two amperes

and a rear lamp of four volts .4 ampères represent the normal lighting load. When the lamps are put in series the total resistance will be twelve ohms, and the current through both lamps consequently one-third of an ampère. The voltage at the lamp terminals will, however, now be 3.33 for the rear lamp, and only .66 for the head lamp.

Verb. sap.

A method well tried by the present writer during the past two years, and perfectly satisfactory where considerable dimming is not objected to, is to divide the battery where the two cells are bridged and insert a "series-parallel" switch of the orthodox type, so that one can get either two volt or four volt without risk of disturbing the balance of charge between the two halves of the battery. This condition is very difficult to rectify when once set up, and is a great argument against the adoption of the selector type of switch, which only makes use of one side of the battery when dimming. Naturally, the system given above can only be applied to a four volt or eight volt battery, and not to a six volt one.

Referring to a further letter on this subject in *The Motor Cycle* for December 30th, "X.Y.Z." is quite correct in saying that a dimming resistance should not be inserted in the dynamo circuit, but the reason he gives for this and the phenomena he foretells, should this mistake be made, will cause amusement to those conversant with dynamo design. In the case of nearly all dynamos designed for vehicular use a very sloping "external characteristic" curve is usual. Thus a six volt dynamo will frequently give a voltage of fifteen volts to twenty volts at normal speed if the connection to the battery is severed. As a break in this circuit is equivalent to inserting a resistance of infinite magnitude, it follows—and, of course, can be readily proved—that the effect of inserting a resistance in the main circuit between dynamo and battery will raise and not lower the dynamo voltage. There is a further reason which involves the application of "Ohm's law," but the above argument will perhaps bring conviction without labouring the point at issue.

It seems a pity to squash the rather pretty theory "X.Y.Z." puts forward, for it obviously contains the germ of a good idea for electrical self-starters.

G. E. NORTLEY.

Sir,—I have been much interested in the articles which you have recently published on the lighting of the light-weight. In my own case I have a daily journey of 6½ miles each way along dark and narrow country lanes which are within a reduced lights area, but where a good light is essential for the safety of myself and others.

After having used acetylene for years, I have successfully discarded it for electricity, and I nightly rejoice at having abolished "messiness" and "waiting for the smell."

A neat wooden case secured to the top tube of my two-stroke contains a 20 amp. 4 volt accumulator. This lights a .4 amp. screw bulb in the head lamp and a similar bulb in the tail lamp. The head lamp is constructed to take the small size bayonet cap bulb, but, having procured a broken bayonet cap bulb, I broke out the glass and pitch and modified it so that it would take an ordinary flashlamp bulb (see sketch).

The focus of the lamp being readily adjustable, I can

obtain a wide suffused light for foggy nights, as suggested by "Auriga," or a long beam, by which I have been able to read the inscription on a penny when standing 35 yards from the lamp. The lamp holder itself is secured in the lamp by a bayonet cap fastening, and a sufficient length of cable is supplied to allow it to be held to any part of the machine should a repair be required at night.

The accumulator has given no trouble so far. I charge it once a fortnight, though it will actually last for three weeks when used for twenty-five minutes every night. The bulbs have given no trouble. If the one in the head lamp fails, that in the tail lamp can be borrowed to get home with.

ALLON.

### An Interesting Variable Gear.

By this mechanism it is possible to obtain a gradually variable gear ratio, together with a neutral position and a reverse. The engine crank chamber is shown at A, and the engine-shaft carries a chain sprocket B on one side, whilst on the other it has mounted upon it a belt pulley C. Parallel with the engine-shaft is a countershaft D, which is solid throughout its length, and has mounted

upon it a chain sprocket E, driven from the engine sprocket B. This sprocket E is carried on a sleeve free to rotate on the countershaft, and integral at its inner end with a spur pinion F. Next on the countershaft is keyed the boss G of a housing H, which carries the bearings of one or more short shafts which are formed in one with planet pinions J and K. The pinion J meshes with the pinion F previously mentioned, whilst that lettered K gears with a pinion L, carried on a revoluble sleeve, the outer end of which has mounted upon it a second variable pulley M. The outer faces of both pulleys C and M are adjustable by means of the screw thread devices shown, and are coupled up by a mechanism whereby as one pulley is opened out the other is closed, affording a variable speed ratio. So much for the construction. Now to deal with its operation. First of all assume that the pinions F and J have thirty and eighteen teeth respectively, whilst those of K and L have twenty-four teeth each. Assume also for a moment that the belt is removed from the pulleys CM, and that the chain sprocket E is driven from the engine at the rate of 675 r.p.m. The drum H being stationary, the effect will be for the drive to pass through the pinions F, J, and K, rotating the pinion L at a speed of 1,125 r.p.m. Now assume the belt to be placed on the pulleys CM, and an adjustment arrived at which rotates the pinion L at the rate

of 1,125 r.p.m. whilst the pinion F is still rotating at 675. The pinions JK will be rotated, but there will be no tendency to rotate the housing H and countershaft D. If now the variable pulleys be adjusted to rotate the pinion L at the same speed as the pinion F, it will be impossible for the pinions J and K to rotate on their axes, and they will be carried round with the pinions FL, revolving the housing H and countershaft, and providing a "solid," or direct drive. Now, it will be understood that between the neutral and solid drive positions there will be an infinite gradation during which the pinions L and F will revolve at different speeds. When the pinion L rotates at a lower speed than the pinion F the drum and counter-

shaft are rotated in a forward direction. If, however, the pinion L runs faster than that, F, the relative dimensions of the pinions F, J, K, and L provide a reversal of rotation of the housing and countershaft.—C. H. Ingall, No. 6,850, 1915.

### A Bowden Lever Improvement.

In Bowden mechanism the operating wire usually actuates some device (an exhaust valve lifter, for instance) which is provided with a spring which keeps the wire in tension, and the tension of the wire in turn holds the operating lever stationary up against a stop. After use, however, the cable may stretch, with the result that the lever is not securely held, but is allowed to chatter. The illustration shows an inverted lever A, pivoted at B, and actuating a cable at C. At D is shown the stop against which the lever should rest, and in order to prevent chattering of the lever a special spring E is provided, which presses the lever up against its stop, irrespective of any other spring acting through the cable. Thus, if the cable should stretch, the lever A is securely held by its spring E.—H. A. Lamplugh, No. 20,124, 1914.

### F.R.S. Lamps in Dublin.

Wayte Bros., of Lemon Street and Duke Lane, Dublin, have been appointed Dublin and district agents for F.R.S. lamps.

### Armstrong Gear Parts and Repairs.

Another firm able to undertake repairs to and supply spare parts of Armstrong gears is the County Cycle and Engineering Co., of Hounslow, Middlesex.

### Name and Address Wanted.

The secretary of the A.C.U. has received a subscription from a member in Newcastle, but as he does not sign his name a receipt cannot be sent to him. He is therefore requested to communicate with the secretary if this paragraph should catch his eye.

### New Everest Address.

Mr. Ernest P. Everest, maker of the Everest carburetter, has removed to new premises in High Street, Newport, Salop, where a section will be devoted to the repair of all types of vehicles in addition to the regular carburetter business.

### M.L. Magneto Booklet.

We have received from the M.L. Magneto Syndicate, Ltd., a most useful engineers' wallet, with pouches at the end containing calliper and folding steel rule. The pocket book contains more than the usual amount of data crammed into these extremely handy works of reference.

### A Good Tyre.

We have had a Cann motor cycle tyre in occasional use for about three years. The mileage stands at about 2,500, and last week it suffered its first puncture through the agency of a nail. The ribs are only partially worn down, and both rubber and canvas are in excellent condition.

### Goodyears in Dublin.

We understand that Messrs. the Goodyear Tyre and Rubber Co., Ltd., have found it necessary to open a depot at 182, Great Brunswick Street, Dublin, in order to cope with their Irish business.

### Review.

"Faults and How to Find Them." (Iliffe and Sons Ltd., 20, Tudor Street, E.C. 2s. 6d.) This book may be said to be a companion to the well-known motor cycle handbook, "Tracing Troubles," since both are arranged in much the same way. "Faults and How to Find Them," however, deals with motor cars, and is a book which should be of inestimable value to the owner of a car, whether light or otherwise. No fewer than 200 possible faults are mentioned, together with the best means of putting each right, so it can be clearly seen that the subject has been dealt with in an efficient manner.

"DE LUXE" pattern tread.

# CLINCHER JUNIOR

MOTOR CYCLE  
TYRES are specially  
made for the  
increasingly popular 'LIGHTWEIGHT.'

Such machines do not require heavy cumbrous tyres but those designed for the purpose which are both durable and reliable.

Flexibility is essential for comfort, and strength is essential for reliability.

Clincher Junior Tyres are designed for—not adapted to—lightweight machines, and they possess real strength both in the casing and on the tread, while owing to the singular method of manufacture they are very resilient, and therefore render comfort to the rider and protection to the machine.

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd.**, and crossed **& Co.**

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pay carriage one way. For all transactions exceeding 10 in value, a deposit fee of 2s. 6d. is charged, when under 10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

## MOTOR CYCLES FOR SALE.

### A.J.S.

A.J.S., 6h.p., 3-speed countershaft, kick start, clutch, new Gloria sidecar, 2 head lamps, rear lamp, watch, mirror; bargain, £63.—Vickers, Newsagent, Brandon Colliery, Durham. [X887]

1914 6h.p. A.J.S. and Sidecar, C.A.V. electric head and tail lamps, with 6 volt accumulator sidecar fitted with hood and wind screen; any trial by appointment; £67.—86, High Rd., Lee. [866]

6 h.p. A.J.S., 1914, 3-speed countershaft gear, free engine, fitted with Gloria sidecar, fitted with Lucas lighting set, Lucas horn, rear light, tools, and spares; any severe trial given; mechanically sound; new; 70 gns.; rare opportunity.—Wauchope's, 9, Sh Lane, London. [X947]

6 h.p. 1916 Model A.J.S. Motor Cycle de Luxe, fitted superbly, having 3-speed gear and clutch drive only delivered by manufacturers recently to the ord of an officer on leave; having suddenly to return duty, he offers this machine, which cost £88, £77/10; used once only.—Officer, c/o Motor Supply Co., Chard. [88]

6 h.p. A.J.S., almost new, not done 500 miles, with Milford tandem sidecar, with special spring cushion, fitted with Watford speedometer, Lucas head lamp and tail lamp, Lucas horn, sidecar lamp, 2 spare tubes and tyre, plugs, about 2 gallon Petrol Motorcar, splendid condition; reason selling, ill-health cost about £110.—Apply, Batt, Chemist, York. [X93]

### Aldays.

ALLDAYS Allon, all models: immediate delivery easy terms 2% extra.—Referee Cycle Co., 332, High Holborn. [07]

ALLDAYS Matchless, 1915, 2½ h.p., 2-stroke, 3-speed clutch, P. and H. lamp, Dualop belt; £27.—Albert Rd., Abergavenny. [85]

NEW Allons, 2-speed models £42, single-speed models £34; delivery from stock; cash or extended payments.—Wauchope's, 9, Shoe Lane, London. [X94]

ALLDAYS Matchless, 1914½, 2½ h.p., 2-stroke, split did condition, new Stelastie tyres, £20; also 11 wicker sidecar, £2, or close offer.—11, Rockhall Rd., Cricklewood. [85]

ALLON, 2-stroke, or Allon 2-stroke. Nothing further to buy. Fully equipped, even to the petrol oil for your first journey; call and get particulars.—C more Depot, 261, Deansgate, Manchester. [85]

ALLDAYS Allon, bargain, new April, 1915, 1.5 miles only, 2-speed gear, speedometer, horn, mirror, P. and H. 610, head light, generator, connected, light, spares, tyre and tube, chain, piston rings, tools, used only summer months; owner bought Morgan £35; in perfect condition.—Archer, 112, High St. Strood, Kent. [85]

### Antoine.

5-h.p. Twin Antoine, Chater-Lea, and C.B. sidecar B. and B. mag., Whittle, watch, carrier; in away: good condition; £25.—73, Parish Lane, Pen [86]

### Ariel.

ARIEL, 3½ h.p., 1911-12, Bosch mag., new tyre £20.—A. Speechley, 45, Church Rd., Acton. [88]

ARIEL, 2½ h.p., h.b.c., mag. wants adjusting; £51.—Smith, 16, Queen's Av., Whetstone, London. [87]

ARIEL, 3½ h.p., 3-speed, sporting sidecar, all accessories; £30, or exchange for higher h.p., with adjustment.—Thain, 40, Bessford Rd., Waltham [X95]

## MOTOR CYCLES FOR SALE.

Douglas.

1914 2½ h.p. T.T. Douglas, 2 speeds, lamps, tools, all accessories, excellent condition, little used; £38.—436, Whitehorse Rd., Thornton Heath. [8799]

4 h.p. 3-speed 1915 Douglas, only run 1,500 miles, speedometer, lamp, horn, complete, guaranteed; £55.—Brook Motor Cycles, Burnham, Som. [8577]

DOUGLAS, 2½ h.p., 1915, Colonial model, 2 speeds, accessories, good order; bargain; owner at front; £42.—Barkston Garage, 244, Earl's Court Rd. [8561]

DOUGLAS, 1914, 2½ h.p., T.T., special, fast machine, 2 speeds, new tyres, long exhaust pipe; £36.—Percy and Co., 357, Euston Rd., London. [8713]

DOUGLAS War Office Model, 2-speed; £54/12; just arrived from works; immediate delivery.—Wilkins, Simpson, and Co., 11, Hammersmith Rd., London. [8604]

DOUGLAS, 2½ h.p., 1914, T.T., lamps, speedometer, horn, full tool kit, complete; £35.—K. C. Campbell, 2nd Lt., O.C., 11th Border Details, Coddford, Wilts. [8643]

DOUGLAS, October, 1914, 2-speed, T.T., Lucas head and tail lamps, Lucas, horn, fast, exceptional condition; £39.—Todd, 181, Plymouth Grove, Manchester. [X9438]

Sidecar use.

**"A Most  
Pleasurable  
Run"**

has often been the Rider's involuntary verdict after a trip awheel—and precisely this frame of mind is ALWAYS—not merely often—the natural possession of the prudent Motor-Cyclist who rides a machine fitted with the famous

## DRUID MARK II

Spring Fork, because —he KNOWS what makes the difference!

Getting right down to DRUID Facts he finds that the DRUID MARK II. is the ONLY Fork which absorbs every class of shock, both Vertical and Horizontal—and more, absorbs them actually WITHIN ITSELF, leaving the frame and handle-bars perfectly free from all Vibration.

What better criterion, then, for the luxury of perfect-riding comfort in 1916, than for YOU to share in Druid experience?

Don't hesitate a moment to write us for full details

**CANE** Sidecar, side door, good condition; £3 or offer.—Mackenzie, Schoolhouse, Macmerry. [8569]

**PHENIX** Sidecar and Phoenix Sidecar Bodies.—We are actual manufacturers. Established 1889.

**PHENIX** Sidecars.—38 models to suit all motors. Write for list.

**PHENIX** Sidecars.—1916 list now ready; immediate delivery; largest stock in London.

**PHENIX** Sidecars.—100 complete sidecars always in stock; Harley and American models.

**PHENIX** Sidecars.—Coachbuilt from £8/5, wicker and cane from £5.

**PHENIX** Sidecars.—We make special models for American motors from 11 gns.

**PHENIX** Sidecars on Hire; exchanges made; good prices allowed for other makes.

**PHENIX** Sidecars, second-hand. We have always a large selection from 50/-.

**PHENIX** Sidecar Bodies.—Special line in coachbuilt from £2/5; own make.

**PHENIX** Sidecar Bodies.—Guaranteed largest stock in London; several stock-soiled and clearance.

**PHENIX** Sidecars.—Largest and most varied sidecar and body catalogue published.

**PHENIX** Sidecars are manufactured throughout in our own works; originators of the Phoenix Tricar forecar, popular throughout the world.

**PHENIX** Sidecar Dept., Proprietors Phoenix Motors, Ltd., 736, Holloway Rd., and 4, 5, 6, Ormeron Mews, London, N. Tel.: Hornsey 449. T.A.: Sycarnix, Upholl, London. [2218]

## The Case of Disabled Motor Cyclists.

**T**HE fact that approximately twenty million pounds has been subscribed to the various war funds reflects in no unmistakable fashion the spirit of our people. But funds do not exhaust the good work which is quietly proceeding in the ultimate interests of our fighting men. Committees, whose special work it is to study the conditions of men who return home from the war permanently disabled, have, perhaps, the saddest work of all. It is a subject we have dealt with before, as nothing can be more impressive or more likely to arouse the innermost sympathies than the sight of a finely built fellow who has suffered the loss of a limb in his country's cause. It is obvious that many such men will be unable to follow their previous calling in life by reason of their disabilities, and their welfare is a cause in which those able to do so should interest themselves without delay. Consequently we are very gratified indeed to note that a scheme outlined by our parent journal *The Autocar* to provide co-operative assistance for such men, particularly in the matter of finding suitable work, was adopted readily and enthusiastically by a preliminary gathering at the R.A.C. last week. Those present were representative of all the leading bodies connected with the motoring movement. The cause is such a noble one that it was only fitting that all the societies, representing manufacturers and traders as well as the private side of motoring, should have lent their aid to preserve that cohesion of effort which spells success to any huge enterprise of the kind.

The interests of motor cyclists will be well looked after by the Auto Cycle Union, whose particular work it will be to examine the cases of men who before the war, or during the war, were connected with the motor cycle. For every such man, who is permanently disabled by the loss of a limb, it will be a duty and a pleasure to find some work properly suited to his

capacity, and here the advantage of co-ordination of effort will be reaped, for motor cyclists, in the main being young and adaptable, will have the opportunity of taking up work in connection with each and all of the different spheres of motoring. Every true Briton will wish the new scheme success. It has been adopted not a moment too soon, for it is conceivable that, with the magnificent response of motor cyclists generally to the call of their country, the percentage of disabled men requiring special treatment will increase. The Government pension is not adequate, welcome as it will be, and must necessarily in many cases be insufficient unless the disabled man can secure employment to supplement it.

## Obstacles to Overseas Trade.

**F**URTHER proof has reached us from different quarters that our remarks in the last issue on the subject of exports of motor cycles were not untimely. There is not a manufacturer to-day but is ready, and indeed anxious, to carry out Government proposals in any attempt to assist the country, and, whether the Board of Trade knows it or not, its appeals to traders to specialise on Overseas orders have been supported enthusiastically in the motor cycle world. We have evidence that every maker has come to regard the exportation of at least twenty-five per cent. of his output as of paramount necessity. Some of the larger firms have actually gone further than this, and we have already mentioned the patriotic offer of a firm to export the whole of its production if the necessary facilities can be obtained. We find on enquiry that there exists in the minds of manufacturers something approaching indignation that obstacles should be placed in the way of exports; probably the exposures of the heavy North Sea traffic in foodstuffs have been the means of creating the discontent. Be that as it may, quite a number of firms have to wait long periods for licences to export.

# THROUGH FIFTEEN COUNTIES

## *A War-Time Sidecar Tour*

Clifton Suspension Bridge from the Bridgwater Road.

I WAS forced to forego a tour in 1914 owing to the outbreak of war, but in 1915 the need of a few days' rest could be put off no longer, so early one Saturday morning last August I set out on a 4 h.p. single Bradbury and sidecar for a trip to the South from Manchester. After a non-stop run to Shrewsbury, we ran into a heavy downpour of rain, but, thanks to oilskin coat and waders, the journey was continued: the passenger, protected by a storm apron and small umbrella with short handle, suffered no inconvenience. A few miles further on some fellow tourists mounted on a similar powered machine were overtaken, but their heavy sidecar with hood and screen told its tale, and after a tussle we managed to give them the slip on the next hill. A stop at Leominster for lunch was acceptable after forty miles of mud and rain.

The rain now ceased and we had a pleasant run into Gloucester, where, on the outskirts of the city, a cottage was found where tea was provided and an amusing half-hour was spent examining numerous wind-propelled images on poles, made by the tenant, to scare birds away from the fruit trees.

Once more on the road, the first puncture of the season was experienced—a nail in the front wheel; this was soon put right, and a run of a few miles brought us to Almondsbury, a delightful spot near Bristol. Here we put up for the night in a modest

and well-kept hotel on the main road, commanding a fine view of the River Severn in the distance. We covered that day about 180 miles.

### Photography Banned.

Next morning, skirting Bristol, we found ourselves on the Bridgwater Road, where we met with a reminder of the war in the shape of military guard, who threatened court martial if the camera were not at once put away. Naturally we complied and continued our way through Bridgwater and Taunton, where some motor cycle machine gun outfits were seen. A turn here was made for Honiton via the Blackdown Hills—seventeen miles of very hilly country. However the second gear proved low enough for these hills, but on the nine mile run to Sidmouth the low gear was required for the first time on a hill where a motor car was seen towing a solo motor cycle.

The views of the Devonshire hills here are perfection, so a roadside lunch was very much enjoyed.

The second night's stop was made at Sidmouth, where many beautiful spots may be visited afoot, and a pleasant afternoon and evening was enjoyed, the only regret being that the military and naval guards prohibited any photography.

Making an early move eastwards next day, we ascended Trow Hill—another local terror. The hilly coast road to Lyme Regis called for caution and

Map showing the route taken by H. W. D.

through Fifteen Counties.—

Good brakes, after which the road through Bridport and Dorchester seemed monotonous. We therefore appreciated the change when Bournemouth and Christchurch were reached, and enjoyed a glorious run through miles of forest and splendid roads to Lyndhurst. We made Southampton our headquarters for the third night. This place proved most interesting, reminding one of Chester with its old walls and bar gates.

Before resuming our journey the slack was taken up in the rear chain. We left the town by the floating bridge, and a seventeen miles run brought us to Portsmouth, where many interesting sights are closed to visitors owing to the war, but Nelson's flagship, "The Victory," can be seen from the shore. Passing through Havant, Chichester, with its many ancient buildings, and Arundel, where we stopped to visit the castle, we arrived at Worthing, famous for its sunshine.

A five-days stay here allowed of many trips along the coast to Brighton, Eastbourne, and other places, including Shore-

ham Aerodrome, a few minutes run, to see the army flying men at work. The fig tree gardens at the old-world village Tarring, founded by Thomas à Becket, were in full fruit and are worth a visit.

After a crowded five days, the return journey was made by the way of Horsham, Aldershot, Odiham, Reading, and Pangbourne (near here the road runs along the riverside for some distance) to Oxford, where a stop was made for tea. The road out of the city of Woodstock was horribly bad, but then followed a ride through some lovely scenery to Stratford-on-Avon, where it was a relief to find the streets lighted at

#### FAR AWAY FROM THE RAVAGE OF WAR.

A fine stretch of road between Bristol and Taunton.

was the only adjustment. Thus ended a most enjoyable and health-giving tour through scenery as varied as it was delightful. H.W.D.

A quaint inn on the Blackdown Hills between Taunton and Honiton.

Near Pangbourne—a Thames Valley beauty spot.

### Starting a Four Cylinder.

During my first trips on the Henderson four-cylinder I regarded engine starting as something of a nuisance, seeing that I am still a devotee of first-class tune and the push-and-run, as opposed to the kick-starter, and the four-cylinder has no valve lifter. I subsequently learnt wisdom. Once the four-cylinder is warm, there is no need to dismount, put the machine on the stand, and wind at the handle. I just put my right hand down behind the calf of my right leg, pluck the handle out of its grip, engage its dog, and twitch it gently upwards, when the engine invariably responds. Of course, the 1916 Henderson has a kick-starter, in lieu of a handle, and I am ready to bet my boots that there is no easier starting engine in the universe.

### Time the Healer.

An expert motor cyclist writes with withering indignation of the appallingly bad two-strokes which have been palmed off on many army officers for urgent use on military duties. I quite admit that some frightful rubbish has been bought at absurd prices by ignorant subalterns, but I do not know that any very great harm has been done. The machines, though bad in many cases, will go, and keep on going, and are quite equal to the pottering duties required of them about camps and training grounds, though less suited for the cross-country trips to visit the best girl on week-end leave. In any case, they were usually the only machines available, the better-class firms being busy with more important work. If anybody has a grievance, it is the unfortunate purchaser who buys at an outside price, and has to unload as best he can when he is ordered abroad; but this grievance has hardly arisen yet, for as far as I can perceive, the original buyers are disposing of these caricatures at nearly their original price to greener and more newly-joined "subs.," and when the war is over, and the relics are thrown on the market, they are not likely to be worth more than they will fetch! No anxiety need be felt about the future.

### When Insulating Tape is Handy.

Gentle reader, it is always a dangerous thing to be what the Yanks call a "highway incinerator," but doubly so when you indulge your speed foibles at night, and burn electricity. The other night I was drilling a head gale at 30 m.p.h. along a road which I barely know. Suddenly I got the needle about my electric lighting outfit, some details of which I knew to be shoddy. I soliloquised, "What if the head lamp suddenly dowses the glim!" I pulled myself together, rebuking my coward heart for age and nerves, and reopened the throttle, when, sure enough, the head lamp promptly went out. Machine and I together charged over a turf kerb, and rocketed about on the rough grass of the Wiltshire downs for a breathless eternity, before I could pull up. A wire had merely

shaken off the battery terminal. When I reached home, I invested in a shillingsworth of insulating tape and lashed every connection on that lighting circuit until the studs lay hidden beneath shapeless heaps of coagulated tape and adhesive. My awesome experience can now only be repeated if a filament goes.

### Noise a Safeguard.

With all due deference, I beg to repeat that I am quite seriously and deliberately an advocate of moderately noisy motor bicycles. In this matter I probably fail to represent the opinions of my colleagues on the staff of this paper, of the motor cycling authorities, of the trade magnates, and of the riding public in general. But I still stick to my guns. The average pedestrian has a child-like trust in motorists—he rarely troubles to dodge us, but is certain we will do our best to dodge him; and he steps blandly off the kerb into the road with his eyes glued to the latest *communiqués* from Paris. The roads are becoming crowded with motorists of little experience, less imagination, and no judgment. I ride month in and month out, in all parts of Great Britain on all kinds of motors; and I become daily more impressed with the perils which beset the habituated motorist, daily more pessimistic about the common sense of the average pedestrian, the average cyclist and a vast number of motor car and motor cycle owners. Though I call myself (thanks to a certain imagination and a very prolonged experience) rather a resourceful and sensible driver, I have had squeak-innumerable during the past twelve months. My knowledge, my judgment, my control of my vehicles and my caution are all steadily ripening; yet each year brings an increasing ratio of hair-breadth escapes. I am unwilling to dispense with a single safeguard, and I find a moderate and continuous noise the best insurance for my vehicle and its occupants. I drive far more slowly and cautiously in populous areas than I ever dreamt of driving years ago; I employ the most penetrating alarms that ingenuity can discover or money can buy; and still—I am sure of it—the risks show a tendency to increase. Finally, from time to time, I may chance to take out an absolutely inaudible Rolls-Royce or big Matchless, with its *pianissimo* sibilant hiss as it runs throttled down to the pilot jet. On such days my remaining hairs assume an absolutely vertical attitude, and a large percentage of these survivors tend to bleach themselves rapidly. And—here's the crown of my argument—the silent motor cycle is infinitely more dangerous than the Rolls-Royce. The latter is at least big enough to catch the tail of a road-user's eye; when he is walking recklessly at an angle across its front; but the cycle is as unassuming in bulk. By all means give me a pedal which will silence the engine temporarily when I pass the tan strewn outside a sick room, when I flit past a place of worship on Sunday, or when I overtake a funeral; but for all ordinary purposes, give me noise, and plenty of it.

## SIGNALS.

An Account of the Work of a Despatch Riders' Section  
from the Officers' Point of View.

**A**FTER this war the learned in such things will have to write a treatise on the psychology of the motor cyclist, for indeed he does things entirely without parallel, as will be confirmed by those whose lot it has been to control any number of these enthusiasts.

In the far-away beginning, the writer first encountered the individual who is termed a "despatch rider" (irrespective of his actual job) by meeting a real "Knut" slowly pushing a Douglas within one of His Majesty's dockyards. From the Douglas depended the brake rod, while the carrier appeared distorted, and, from everyone having authority, the "Knut" was requesting the whereabouts of the nearest garage. To him presently came an inflamed petty officer wanting to know why the, where the, and how the, he (the Knut) came to be in such a situation, and whether the lost one thought that dockyards contained garages for withered, singed, and blistered people newly imported into His Majesty's Service. All the "Knut" would say was, "Well, I always get a garage to do my repairs."

The rim of a 17in. shell hole and the remains of a railway station at Ypres.

Later it fell to the writer to see a great deal of twenty-eight enthusiasts provided with a number (never twenty-eight) of Douglases; indeed, it was seldom that the enthusiasts themselves would tally off to the required number, some always being in trouble. Now when a detachment departs to the unpleasant parts of France or Belgium, there is generally much to interest a student of human nature, and in the course of a prolonged stay a thousand small details show of what types are the men one has to look after. In our case

the motor cyclist was so necessary that without him, several of him, we were lost. He fetched the letters daily, going sixty miles to do it, carried reports of our little fights, demands (constant demands I may say) for further supplies, traced lost supply columns to their place of concealment, and fetched newspapers, bootlaces, or tinned delicacies from the nearest town. Moreover, he lay in ditches while the cars sent shell after shell over his head, slept with the gun crews in ice-cold bivouacs before action, and staggered up shell-pitted roads under a load of ammunition boxes on dark nights when the air was full of bullets. My orderly was one such man; he cooked omelets to perfection, "foraged" for wine, helped me steal a bed for a deserted billet, and generally was indispensable.

### The Idiosyncrasies of Riders.

Thus our twenty-eight enthusiasts were hard worked all the time, and, being hard worked, had some amusing failings. Firstly it must be explained that some of them knew very well what a motor cycle was, while others had merely a vague idea, and it was this mixing of mechanic with ex-private owner that caused trouble, as the mechanic had to be watched every second else he would "tune" his machine on a system of his own, while some of the others must be equally minutely observed or they would destroy their machines through neglect of detail adjustments.

Now, one thing that all came up against was the fact that the riders never realised the machines were not their own. Moreover, the authorities, however foolishly, insisted that these machines *were to be kept as delivered*, setting apart divers horrid penalties for those who would break this rule. Consequently one's "spare" time was taken up inspecting bicycles, and never an inspection came to a conclusion without trouble. One man, for instance, had become annoyed with the forward Douglas footrests, and had sawn them off, opining that the machine looked better. When wrath unlimited fell upon him, he would stand with open mouth and protruding eyes bereft of explanation. Another had "tuned" up by removing the end of his silencer, and yet another, peevishly, had thrown away his carrier, while a particularly "hard case," disliking the familiar Douglas T.T. bars, in some mysterious manner had put his through a fire and altered them to an exaggerated Brooklands form.

As to the smaller details which go to make a machine, one man fitted an adjustable pulley and threw away the Government one. Several people "did without" an ignition control, while saddles and tool kits were a perpetual source of bickering.

Naturally there was trouble, and the enthusiasts were astonished to find that the Government did not

**Signals.—**

want its bicycles "tuned," altered, or even painted a different colour, vexing the souls of motor cyclists who did these things, and bombarding the O.C. with official correspondence which threatened to continue for the rest of his life. They even rudely insisted on the removal of all the additions and the replacement

Part of the Cloth Hall at Ypres, which has probably seen some of the worst fighting and shelling on the British front.

of the original details, failing which they desired payment for the missing members.

As to equipment, I do not believe that there was one cyclist in the squadron who could keep his personal belongings for three days on end, while some of them lost even their rifles, with dire results. Another peculiar trait is that no motor cyclist conceives himself to be impregnable until he has both a rifle *and* revolver. That is to say, if he has a rifle he wants a revolver, and if he has a revolver he beseeches one to let him have a rifle.

**Revolver Practice.**

Now, for my sins, I had made a small range for Maxim instruction, and in a weak moment gave out that those having revolvers or pistols might practise in the evenings. At five o'clock I found a long line of the most peaceable motor cyclists, each with his most ferocious expression and an enormous "hand cannon" dated somewhere about 1870, while our best storekeeper (who incidentally was Crompton of cycle car fame) grasped a minute automatic which I knew from experience jammed every four rounds. However, as there was no time to bring an armoured car for me to sit in, at it we went, and for ten minutes the air was full of noise, smoke, and flying cartridges. Fortunately there were no casualties, but the erratic firing of the elderly weapons, combined with the fact that nearly all the flash came out of the rear end of the chambers, satisfied everyone, whilst Crompton, as usual, retired early to unjam his favourite weapon.

So much for the peculiarities of the motor cyclist. Comes now his riding. In this he may be divided into three classes—those who rode as if for a record and were properly chastised when we discovered their actual speed, those who rode slowly and always got there, and those who could not ride five miles without getting off and playing with their engines. The latter class contains, I fear, too many of the mechanics, and, moreover, it interfered with the arrival of their mes-

sages, however much it may calm their souls by restoring the pristine Douglas bark. The second class did real good work, and the first, as I have said, knew trouble. From this you will see that one's own motor cyclist despatch riders were a handful enough to occupy any man's leisure moments, and something of a worry to the thoughtful, but they were as nothing to the D.R.'s of other people.

**Night Messengers.**

Indeed, when one was away trying to sleep in what the shells had left of a house the purr of a Douglas got on one's nerves. As surely as the rain would haze the view and make dark puddles upon the floor, so surely would a damp individual roar up to the billet just as one had turned into the inevitable "flea bag" for the night. All sleep would then vanish as the machine spat and banged while pulling up, and, with a sense of intense irritation, one had to light a candle, search for watch and pencil, and await the rider. The latter, when he does come, drips puddles over one's bed while he fumbles through his leather despatch case, eventually producing either the *communiqué* for the day, in which case all is well, or orders to move to some appalling place twenty miles away. You then sign, and the malignant visitor climbs on his machine and goes off to worry someone else. In time you get so nervy about messages that the mere noise of a motor cycle engine in the distance wakes you out of as sound a sleep as may be obtained in a bag on the floor.

Thus there is much to be said for one man who solemnly swore that when the war was over he would buy a house with a huge and cosy bed, also a motor cyclist, whom he would train to rush up at various hours during the night, come into the room, salute and say, "Message from the General, sir," to which our friend would make answer, "Tell the General to navigate to the extreme boundaries of the underworld," and turn him over to sleep.

Altogether, our despatch riding friends were very interesting study and show that the average motor cyclist has the happy knack of quickly adapting himself to whatever he puts his hand to. S.H.D.

A BRITISH MACHINE USED BY A FRENCH MILITARY CYCLIST.

M. Armand Singer, who is attached to the 269th Section T.M. of the French Army, and the 3 h.p. Royal Enfield he has ridden for many months.

## ACCESSORIES

- (1) Accessories.
- (2) Sidecars.

- (3) Tyres and Clothing.
- (4) Ignition Appliances and Lamps.

## IN FOUR SECTIONS.

The review of new sidecar designs and accessories in the following pages comes at an opportune moment, when machines—many second-hand—are being fitted up in anticipation of spring. It does not profess to be complete, but nevertheless readers will find much to interest them in the mass of information and illustrations which we have compiled.

**Apollo Motor Cycle Electric Horn.**

Among the many motor cycle accessories sold by the Apollo Mfg. Co. is the motor cycle electric horn. This is very substantially made. As it is designed to take a very small amount of

current, it being stated that  $\frac{1}{2}$  amp. is the maximum amount taken, it may be worked by a dry battery carried in a leather case. The wiring is of the two-wire pattern, in order to avoid any risk of short circuit in wet weather.

Apollo Mfg. Co., Moseley Street, Birmingham.

**The Doubleway Strap.**

Motor cyclists often have a difficulty in strapping a parcel on to a motor cycle carrier. A device which will be of considerable utility for this purpose is the new Doubleway strap lately placed on

the market by Messrs. James Grose, Ltd., 4, Old Jewry, E.C. The strap is enabled to hold the box at four points owing to the ingenious design of the special buckle employed. The strap is made of webbing, and can be had in any size.

James Grose, Limited, 4, Old Jewry, London, E.C.

**A Three-way Connection.**

A useful accessory manufactured by the Leicester Rubber Co. is a three-way connection made of brass for connecting rubber tubing. It enables the head lamp and tail lamp to be operated from the one generator. The rubber tubing manufactured by this firm is also worthy of notice. It is stout and practically "unkinkable," yet at the same time very flexible. It is specially suitable when long lengths of tubing are used. The

Leicester Rubber Co. are the makers of the well-known John Bull tyres, belts, and repair outfits.

Leicester Rubber Co., Ltd., Granby Rubber Works, Leicester.

**Dover Grips.**

Among the many useful fittings made of Exonite by Messrs. Dover, Ltd., is a neat hook end handle grip. The hook of this grip is integral with the body of the grip, and therefore cannot break away; it is secured to two metal rings incorporated in the exonite shell, so that any strain thrown on the hook is taken by the bar when fitted.

Dover, Ltd., Northampton.

Interior mechanism of the Smith speedometer.

**The Smith Speedometer.**

Messrs. S. Smith and Sons are the actual makers of a very excellent speedometer, which works on the centrifugal principle. The interior mechanism is slightly different from that found on others, and a few words concerning its

working may be of interest. The governor, which is provided with a cup-shaped flywheel, has a sort of gyroscopic action, which ensures steady running. The governor itself, which is fixed to the spindle and revolves with it, consists of two steel cross members provided with brass weights at each end. As the speed of the spindle increases the governor

tends to assume a more and more horizontal position, and in doing so moves a double collar connected with the governor proper by means of a short shaft, which tends to pull up the collar and carry with it a spindle lying between two portions thereof, which, being attached to a toothed quadrant meshing with a pinion fixed to the spindle, conveys the motion to the indicator hand which is attached thereto.

Messrs. S. Smith and Sons, Ltd., 179-185, Great Portland Street, W.

## Accessories.—

## Some Useful Accessories.

Besides the well-known Jones speedometer, which was one of the first to be adapted for motor cycles, Messrs. Markt and Co. find the Veeder cyclometer to be a very popular instrument. The illustration shows this driven by the usual type of spur gearing, while inside there is a spiral gear. The type of spiral gear employed is shown in the illustration of the speedometer drive, on which it has been proved to be most

successful. In the least expensive type of speedometer bevel drive is used.

Another useful accessory sold by this firm is the Little Giant jack, which is exceedingly light, and weighs only 2lb., while when folded it only occupies 7½ in. It is quite suitable for sidecar work.

Messrs. Markt and Co., Ltd., 98-100, Clerkenwell Road, E.C.

## Binks Auxiliary Tank.

The Binks jet damping carburettor remains practically unaltered for this year. This carburettor, it is claimed, is such an excellent vaporiser that almost as good results are obtained with it with paraffin when the engine is once warm as with petrol, which at the present time costs more than twice as much per gallon. To assist in starting from

cold when either paraffin or the special cheap fuel sold by C. Binks and Co. at 1s. per gallon is used, the firm manufacture a small auxiliary tank to fit behind the seat tube, in which is carried a small quantity of petrol. This is conveyed to the carburettor *via* a two-way tap also communicating with the main tank. The cheap fuel is then carried in the main tank, and the tap turned

into communication with it after the engine has been warmed up on the petrol.

C. Binks, Ltd., Church Street, Eccles, Manchester.

## The Stanley Spare Link and Shield.

Users of belt drive who employ adjustable pulleys have found the Stanley spare link for the purpose of quickly lengthening or tightening a belt to be a very useful accessory, while another useful adjunct is the Stanley

Stanley spare link.

Stanley shield for the belt fastener.

shield, which protects the belt fastener and prevents wear of the pulleys. It has been specially designed for use with the Philipson pulley.

Messrs. the Stanley Motor Belt and Fastener Co., London Road, Bromley, Kent.

## Coventry Chains.

Among the many types of chains suitable for motor cycles, a type which is becoming increasingly popular, especially for the drive between the engine and gear

box of heavy sidecar outfits, is the silent pattern as manufactured by the Coventry Chain Co. Not only is the strength of this chain considerably greater than the roller type, but its silent running and extreme flexibility make it eminently suitable for short high-speed transmissions. For light work, such as dynamo drives and so on, where the ratio between the wheels reaches as much as 3-1, two special small 8 mm. and ¾ in. pitch roller chains are listed.

The Coventry Chain Co., Ltd., Spon End, Coventry.

## Albion Gears.

The Albion gear remains unaltered for the present, the last improvement effected being the addition of a control clipped to the top tube in place of the horizontal lever. The mechanism is extremely simple, the two gear ratios being obtained by sliding dog clutches actuated from the right-hand side through a bell crank. The box is sturdy, and the securing nuts are all on the right-hand face, where they are accessible, while the two studs

holding the box to the bottom bracket of the machine are set in strong lugs, there being a special aluminium clip

plate immediately below the nuts. The Albion gear is to be found on numerous makes of lightweight two-strokes.

Albion Engineering Co., Ltd., Upper Highgate Street, Birmingham.

## Renold Chain Punch.

In addition to their famous transmission chains, which are so well known that the name of Renold and chain are synonymous, Messrs. Hans Renold, Ltd.,

also list a very handy chain rivet extractor. The sketch is self-explanatory. The screw punch, pressing on the burr head of the chain rivet, forces it out of the side plate, rendering it a simple matter either to remove or replace a link or half link. The small drilled table is for placing in the base of the punch when riveting the chain, by means of which the rivet can be forced into place previous to being burred over.

Messrs. Hans Renold, Ltd., Didsbury, Manchester.

## Whittle Belting.

Although leather belts have gone much out of favour of late years as far as motor cycles are concerned, a belt which still remains popular for certain classes of heavy sidecar work is the Whittle. This belt consists of leather plates

screwed together on steel connecting links forming a kind of belt chain. These belts are very flexible, require no fastener, and will drive when quite slack. They have become very popular for the purpose of driving dynamos, cooling fans on cars, and machinery.

Messrs. Thos. Whittle and Sons, Ltd., Warrington.

## Accessories.—

**Philipson Pulley.**

The Philipson governor pulley, which has gained such popularity among motor cyclists, has been improved by the

addition of a cover over the rubber buffer. The pulley in its latest form was described and illustrated as recently as January 18th, 1915, page 497.

Philipson and Co., Bolton.

**1916 B. and B. Carburetter.**

For 1916 the B. and B. carburetter is practically unaltered, save for the flooding button, the alteration to which was described recently. From the perspective drawing the outward appearance of this refinement can be gauged accurately, and the newer design is certainly neater.

As to the instrument, a slow running jet is fitted still, being housed in a separate small choke tube alongside the body of the carburetter; both air and throttle slides follow the older design, and have a long needle which, moving

with the throttle, varies the jet aperture. Above the jet is a cylindrical "ceiling" perforated by numerous holes to allow the petrol to gain the throttle chamber after leaving the jet. As that air which passes the main choke tube and main jet also passes through these holes mixed with the petrol the mixture is atomised very thoroughly. The seating of the float needle is in the lid of the float chamber, and the operating gear reduced to float collar and needle.

Messrs. Brown and Barlow, Ltd., Witton, Birmingham.

**The Watford Speedometer.**

Few speedometers in use on motor bicycles have met with a greater deserved degree of popularity than the Watford. Made by a firm noted for its exceedingly high-grade watches, the workmanship put into the speedometer, which works on the centrifugal principle, is of the very best, with the result that the motor cyclist gets most accurate reading and a very steady indicator hand. These speedometers can be had for front or rear wheel driving, and with and without watches attached.

Messrs. Nicole, Nielsen, and Co., Ltd., Whippendell Road, Watford.

**Illuminated Number Plate.**

A novel form of rear number plate is listed by W. O. Wood, of Stockport. This is so designed that it can be illuminated by means of an electric bulb situated behind the plate in which the identification numbers are cut, behind

which is placed a transparent plate. A red glass is fitted in the centre, and access to the electric bulb is quite easy, the undoing of two nuts being all that is necessary. This contrivance overcomes the difficulty of the front number plate being insufficiently illuminated where the very stringent lighting regulations prevail. This number plate can also be illuminated by the usual acetylene rear lamp if desired.

Mr. W. O. Wood, Millgate, Stockport.

**An Effective Mud Shield.**

A very effective mud shield has been placed on the market by the Cycle Necessities Co. It is attached to the mudguard by means of steel clips which fasten round the edges thereof. It is claimed that when the mud splashes on to the mud flap it does not drain off the edges on to the rider's legs.

The firm make a speciality of studying anti-splash devices. One of these is the Mud Flap Stop, which, like the accessory just described, is clipped on to the guard itself

or the side stays by means of spring clips. The planes or flaps are parallel to the ground, and they can be brought in or out of use by simply a turn of the finger and thumb.

Messrs. the Cycle Necessities Manufacturing Co., Vine Street, Birmingham.

**Sprocket Remover.**

One of the most ingenious little tools we have seen lately is a sprocket remover, the working of which the accompanying sketch renders self-explanatory. The sliding pegs allow themselves to be adjusted to any size sprocket, and a very slight alteration in their shape would

Bransom and Kent's magneto sprocket remover.

render them suitable for the removing of timing wheels.

Messrs. Bransom, Kent, and Co., Ltd., 40, Great Eastern Street, E.C.

**Everest Carburetter.**

This carburetter is now fitted with two lever controls, the air lever having been fitted to render starting from cold somewhat easier. Once the machine is warmed up, however, the instrument is in practice controlled entirely by the throttle, though the air lever at times proves useful on low-powered machines to prevent knocking when overloaded, by temporarily strengthening the mixture. The jet is of the multi-outlet

type, and is controlled by the throttle movement. The passage through the body is oblong in shape, being 12 mm. wide and 25 mm. long, which provides a port of large capacity, while the throttle and air slides are relatively small, the result being a very neat outward appearance. A specially small model is also made for use on small engines, such as Auto-wheels.

Everest Carburetters, High Street, Newport, Salop.

## SIDECAR ATTACHMENTS.

There is an abundance of variety in the design of sidecar attachments offered to the public, both in body and chassis design. The illustrations in the following pages exemplify that fact. Sporting sidecar attachments weighing from 48 lb. complete, and luxurious attachments scaling over five times that amount, are included in the range.

### Montgomery Sidecars.

Of the many models made by Messrs. W. Montgomery and Co. probably the two which will prove the most popular for this year are the double-seated model and "The Lounge." The double-seater is certainly a most luxurious attachment, and is specially suitable for machines with spring frames, as the axle is sprung independently of the chassis. The main chassis is suspended on shackles below the axle on two semi-elliptic springs, while, in addition, the body is separately sprung on comfortable C springs and the special Montgomery spring shackles at the rear, while the front is carried on two lever springs—a system to be commended. Four-point attachment is used, two being quickly detachable screw-up joints with locking devices, the other two being secured by pins, which are also quickly unfastened. The body is not unduly long, although ample room is provided for both passengers, who are seated tandem fashion, as by fitting a fairly deep well beneath the front seat to accommodate the back passenger's feet it is possible to shorten the body very considerably. Entrance to the rear seat is obtained by lifting the front one, which is detachable, and will fold up when not required. An adjustable windscreen is fitted, and a hood with long side curtains. Waterproof aprons are provided for both compartments.

"The Lounge" model has an underslung chassis which is strong and light. The springing of the body is by C springs and spring shackles at the rear, while the Montgomery patent foot springing on lever springs is used in front. The mudguarding is excellent,

as the valance extends nearly to the axle. The body is provided with a dash, which can be lifted when entering or dismounting from the car. Attached to this is the adjustable windscreen, which can be folded right down when not in use. The upholstery of the body is very carefully carried out. The back of the body curves backward, not only giving a comfortable position, but providing considerable protection from dust.

W. Montgomery and Co., 87, Gosford Street, Coventry.

### The Gloria.

The Gloria sidecar, Model No. 5, besides possessing extreme comfort, has a neat and pleasing appearance. One

of the chief features of the chassis is the double head fitting for securing the front attachment to the cycle, whereby the strain is distributed evenly between the top and down tubes of the cycle frame, so considerably strengthening the steering head, yet at the same time the quickness of detachability is in no way affected. Another point is the spring wheel, which has been a

most satisfactory feature of Gloria models for some years. This consists of an arm, which is attached at one end to the chassis on ball bearings, while near the other end the wheel is attached. Above the wheel is a strong coil spring encased in a metal box, which takes the weight, while a small spring is also fitted to prevent any undue rebound. Four points of attachment are used, all of which are quickly detachable. The chassis is continued behind the axle to form a luggage grid, while the space between the rear attachment and the bicycle is occupied by a neat spare petrol can carrier. The body on this model is a luxurious coachbuilt one. Several other models are listed, all having a chassis of the same pattern.

Gloria Cycle Co., Much Park Street, Coventry.

### Bowser Sidecars.

Mr. E. Bowser, of Leeds, is offering attractive sidecars for 1916. Mr. Bowser was one of the earliest to produce a tandem-seated sidecar, and has made a speciality of this type. The more expensive models are fitted with a well-upholstered middle seat, which can instantly be removed by disengaging the brass latches that secure the back rest. When this is done the seat lifts out and can be neatly folded out of the way, so that, to all intents and purposes, the sidecar is then a single-seater, providing ample room for luggage, etc.

The middle seat of this model acts as a support for the sides of the body, equally distributing any undue strain caused by the weight of the front passenger when cornering, and since the body is of rather unusual length it will be realised that

(Left) "Lounge" model Montgomery, and two views of a tandem-seated Montgomery de luxe.

**Sidecar Attachments.—**

This additional support is an important point.

The second model we were privileged to examine is similar in general outline, but the middle seat consists only of a

De luxe edition of the Bowser tandem-seated sidecar.

leather hammock, which can be adjusted by means of notches to any position to suit the convenience of the passengers. To remove the seat is the work of two seconds only, as it is simply lifted out, and can then be rolled up into very small compass.

The chassis of these models are under-lung, and are of very rigid construction. Four points of attachment are provided, and the body, which is excellently upholstered, is fitted with spacious tool box and pockets.

An attractive lightweight model with weed cane body was also brought before our notice. The body is designed on the streamline principle, and behind the

The Bowser light canework sidecar.

passenger's seat is a large locker, in which a petrol can and tools can be stored. The springing of this model is good, and the bodywork has a very well-finished appearance.

Other coach-built single-seat models are listed, but the special features for the new season are as described above.

E. Bowser, Sidecar Manufacturer, 50, Park Lane, Leeds.

**Messrs. Robertson's Sidecar.**

The registered design of frame employed in Messrs. Robertson's new sidecar is a distinct departure from standard practice. It is attached to the motor bicycle frame at three points. The frame consists of an immensely strong tubular axle, below which is brazed an extension to the saddle tube, and from the further corner of this runs the long tube which is attached to the forepart of the motor bicycle frame; consequently, the sidecar frame forms a triangle with the motor bicycle as a base. The springing is also peculiar. The front portion of the springs serves to take the main weight of the body, a further single leaf spring

The Robertson sidecar

on the long tube of the frame taking the weight of the front of the body. The rear portion of the springs serves to suspend the luggage grid and spare petrol tin. The springing of the petrol tin is a most excellent point, as it saves the

The Robertson sidecar chassis.

frame from any possibility of breakage through the carrying of heavy unsprung weight. Few sidecars allow the luggage to be carried on a sprung platform, and we consider the arrangement on Messrs. Robertson's production to be a most important improvement. There are no castings whatsoever in the frame, all parts being acetylene welded. The fixing of the mudguard is extremely substantial. The sidecar can be had with a 28in. wheel taking a 3in. tyre. Another peculiar point is that the front extension tube is attached low down on the frame. It is interesting to note that Messrs. Purcells, the well-known sidecar manufacturers, have amalgamated with Messrs. Robertson.

Messrs. Robertson's Motors, Ltd., 157b, Great Portland Street, W.

**Fitsu Sidecar.**

A somewhat unusual design of sidecar is the Fitsu. The body is made so that the passenger is sitting in a slightly reclining position, while the seat, which is heavily upholstered, is made to follow

The Fitsu wicker body.

exactly the contour of the body to a point below the knees. Both ordinary and underslung chassis are made. Coil springs are used, and the body is supported both front and back on shackles.

Three-point attachment is standard in all models, but an extra attachment lug can be supplied at a small extra charge. One very luxurious model is fitted with a

The Fitsu coach-built model.

detachable coupé top, which when fitted makes a weatherproof outfit from the passenger's point of view.

Fitsu Sidecars, Scalla House, 45, Smallbrook Street, Birmingham.

**Dunhill's Sidecar.**

The Dunhill sidecar has long been a very attractive proposition. The chassis is scientifically constructed, is of the drop variety, and is immensely strong. Wherever possible the triangular form of

The Dunhill screen out of use.

construction is employed, while considerable attention has been given to the bodywork. One of the most attractive features of the Dunhill sidecar is the screen which is shown in the accompanying illustration. It is designed to protect the passenger most effectively from the elements, since it is provided with side shields. It is also attached in such

The Dunhill screen in position.

a manner that it is adjustable in any position. Previous to the passenger getting out it may be swung to one side, as it is merely fastened to the body by means of a thumbscrew.

Messrs. Alfred Dunhill, Ltd., 359-361, Euston Road, N.W.

**Sidecar Attachments.—****An Ingenious Windscreen.**

A windscreen which will find favour among sidecar passengers is that manufactured by Messrs. Curry and Pitcher. It is fixed on to the door, and is opened and closed automatically with it. An apron is attached to the windscreen and fastened thereto, and also to the

front of the sidecar, by means of push buttons, consequently the whole of the front is rendered rain and draughtproof. The whole screen can be detached in a few seconds, and may also be adjusted to any position.

Messrs. Curry and Pitcher, 65-69, Henry Street, Ashted, Birmingham.

**Sidecar Bodies.**

Two patterns of serviceable sidecar bodies are being made for 1916 by Messrs. Bright and Hayles. One is a double-seated body; this is extra wide, and accommodates the passengers side by side. It is constructed of three-ply wood on an ash framework. It is well upholstered, and a roomy compartment

Bright and Hayles lightweight body.

for spares, etc., is provided under the seat. The other model is a lightweight, also constructed of three-ply wood, and when fully upholstered and provided with a roomy tool box under the seat weighs only 19½ lb.

Messrs. Bright and Hayles, 73, Church Street, Camberwell, London.

**Winson Sidecars for 1916.**

Messrs. J. Winn and Sons bring two attractive sidecars before our notice for

1916. All-metal bodies are the chief feature of these smart vehicles. The touring model is very warmly and comfortably upholstered, and roomy tool lockers are provided under front dome and seat.

The sporting model is thoroughly well upholstered, and there is ample seating

accommodation. A good-sized locker is provided in the bulbous back of the body, and this model is extremely smart and graceful in appearance.

Messrs. J. Winn and Sons, High Street Works, Rochdale.

**An Ingenious Sidecar Screen.**

The fault with many sidecar screens is that they are placed far away from the face of the passenger, who, instead of getting the requisite amount of protection, receives the benefit of an excessive amount of back draught. The Glendower screen is quite a clever device. The screen proper is attached to a framework which is pivoted at the

extreme rear of the sidecar body, and rests when in position on two brackets, one each side of the seat. The apron

is attached by turn-buttons to the lower portion of the screen. When out of use the apron is unbuttoned, and the screen swung right back.

The Glendower Motor Co., 3, Glendower Place, South Kensington, S.W.

**The Swan Sidecar.**

Probably one of the handsomest sidecars on the market is the Swan. The chassis is of weldless steel tubing, except the axle, which is of special design built up of square section tube. This axle is curved in shape and formed in two separate parts one above the other, the lower one taking the wheel axle and connection to the machine, while the other is carried right round, forming two uprights upon which the body is suspended on coil springs which are under tension. A stand for the wheel is provided, and when not in use forms a stay for the rear of the mudguard. The body is very roomy, and the shape, with its rounded corners and high sides, is very pleasing. The locker under the seat and pocket in the upholstery provide ample space for storing parts, maps, and so on.

Messrs. Swan Sidecars, Oxford.

**Grosvenor Sidecar.**

The Grosvenor Motor Co. are this year producing a very attractive and strongly constructed sporting model sidecar. This model is produced with or without side door, and is efficiently sprung on the

lines of the heavy touring sidecar. It will be observed that a disc wheel is fitted, and this adds much to the sporting appearance.

The Grosvenor touring model, which is also illustrated, is designed on attractive lines. We understand, however, that the makers are making a special

effort to cope with the increasing demand for the lightweight.

Grosvenor Motor Co., Bradford Street, Bolton.

**Royal Leicester Sidecars.**

Among the many different model sidecars listed by Messrs. Stokes and Holt Ltd., perhaps one of the most interesting is the special double-seated model. The body is 72in. long x 18in. wide, and the two passengers are carried tandem fashion, a separate door being provided for the entrance of each. It is claimed that two adult passengers can be carried comfortably. The body is nicely finished, and is mounted on a chassis of the underslung pattern on Cee springs and long shackles. The springs run the

whole length of the chassis and coil a in front; to this part the front portion of the body is attached, also on shackle. Four-point attachment is used.

Messrs. Stokes and Holt, Ltd., Bridgegrave Road, Leicester.

## TYPICAL EXAMPLES OF SIDECAR ATTACHMENTS.

(Left) Touring Watsonian, and (Right) sporting canework Watsonian.

## Watsonian Sidecars.

The Watsonian tourist model N is a thoroughly comfortable touring sidecar, yet, at the same time, quite light, and intended for use on machines of low horse-power. The chassis is strongly built, and is dropped below the level of the wheel axle to give a low riding position. The springing can be had in either compound coil springs or C type at option. Three-point attachment is used, and the body is low built and of three-ply wood and well upholstered. Two other new models are models S and T. These have the same chassis and wicker bodies.

Model S has a very sporting appearance, being cone shaped in front and slightly bulbous at the back, while a kind of scuttle dash is provided which opens with the door. Model T has a wider body with high sides, and is intended as a light body suitable for serious touring. These three models by no means exhaust the Watsonian range.

Watsonian Sidecar Co., 131, Conybere Street, Birmingham.

## Supreme.

Although hampered by lack of material and skilled workmen the Supreme Sidecar Manufacturing Co., Ltd., are producing a new lightweight model which, it is hoped, will be ready shortly.

A new chassis also has been fitted to the model A car, having a crossbar below the body nose to which quarter-elliptic springs are attached. One tube forms the chassis, this tube being bent round at the front and both ends curved upwards at the back to meet the

Adjustable screen on Supreme sidecar

mudguard is supported by three tubular arms carried out from a bracket on the axle.

The body is unaltered, and has seats with horizontal padding to eliminate bunching of the stuffing, while the special windscreen is retained, this being supported on two horizontal bars, one on each side of the body. To clear the side door the screen is unlocked, then pushed forward, while the angle of the glass also is adjustable.

Supreme Sidecar Manufacturing Co., Ltd., 14, Gt. Hampton St., Birmingham.

## The Bramble.

The Bramble Model No. 1 is a decided departure from usual practice. The chassis is entirely enclosed within the body. It is made of unbreakable angle steel, and to it are directly bolted all connections and springing arrange-

ments. The body is supported on double scissor springs, to which long shackles are fitted. The fact that the chassis is entirely enclosed not only has the advantage of placing the weight very low, but renders the whole outfit extremely easy to keep clean, besides giving a neat appearance. The body is very roomy and well upholstered, and ample space is provided for spares, etc. Special models are made to suit spring frame machines, in which case the axle is separately sprung.

Bramble Manufacturing Co., Ltd., London Road, Coventry.

## The Orto Windscreen.

A very practical windscreen is the Orto, which is provided with side flaps, and therefore serves as a most excellent protection against wind and rain for the passenger. It will be noticed that the screen slides along two rods, and consequently the distance from the rider's

face may be adjusted to a nicety. On the door being opened the screen is so arranged that it swings to one side.

Messrs. A. Atkinson and Co., 24, Arminger Road, Shepherd's Bush, W.

## Some New Sidecars.

The G.K. Sidecar Co. are manufacturers of very practical sidecar bodies. The first of these to which we make reference is the de luxe type. The back is provided with a spring cushion, and is most luxurious. It is designed to swing forward, disclosing at the rear thereof a rack for the tools most commonly needed by the motor cyclist. When in this position it allows access to a large locker, in which clothes or spares may be stored.

Another interesting body is the double-seated G.K. The seats are situated tandem fashion, the seat for the front passenger being of the folding variety, and a strap stretched across the body acts as a back for the front passenger. When out of action the seat folds away, and assumes the form of a sloping footrest for the passenger.

The next to come under review is that known as the cigar pattern or sporting body. It is provided with a low but comfortable seat, and has a semi-cigar-shaped front. It is quite light, and offers little resistance to the wind.

One of the most attractive bodies we saw at the G.K. works was one made of cane covered with patent leather, and practically indistinguishable from a coach-built body.

Messrs. the G.K. Sidecar Co., Lorenzo Works, Lorenzo Street, Pentonville Road, N.

G.K. sidecars—sporting and de luxe models.

axle. Long C springs are then fitted from which to sling the body, while cross members stiffen the chassis.

On the right-hand side is a footplate clipped to the chassis tube, and the wide

## Sidecar Attachments.—

## The Chater-Lea Sidecar Chassis.

The new Chater-Lea sidecar frame is of quite novel design, and is a worthy production of this well-known firm. The frame forms a plain triangle, and, being dropped below the axle, gives a low position. Straight tubes are employed, and these are now stronger and lighter than formerly.

Method of attaching front springs to frame on the Chater-Lea sidecar.

The sidecar is attached to the motor cycle at four points, and the body is suspended from C springs with long shackles, while in front two small supplementary springs support the body. The method of attaching the springs to the

Straight tube chassis of Chater-Lea.

front of the frame is interesting. The apex of the triangle terminates in a short horizontal tube, the ends of the springs are wrapped round the bushes, and the front of the sidecar is secured by passing a long substantial bolt through

Chater-Lea sidecar outfit.

these bushes. A sidecar stand is provided. Altogether, the design is thoroughly practical, and impressed us most favourably.

Messrs. Chater-Lea, Ltd., 74-84, Banner Street, Golden Lane, E.C.

## Canoet.

The Canoet sidecar is probably the pioneer of the boat-shaped, coachbuilt sidecar body and underslung chassis, and many of our readers will remember the sensation it caused when first shown at the 1911 Olympia Show. The essential features of this popular sidecar are unaltered for the coming year, but one or two slight alterations in detail are

all that have taken place. The telescopic tube running from the saddle pillar of the bicycle to the rear of the chassis has now been strengthened by the inclusion of an extra stay, as fully explained and illustrated in our issue of January 6th, and the attachment is now at five points. The handsomely finished body which has gained for this sidecar such popularity has not been altered.

Messrs. Mead and Deakin, Rushy Lane, Tyseley, Birmingham.

## Millford Modifications.

The Millford sidecar has always been familiar to motor cyclists interested in passenger carrying. These famous sidecars will remain practically unaltered

for 1916. The first model to describe is known as the Family model. The body of this model is specially designed to take a small chair in front for carrying a child. Plenty of space is allowed for the extra passenger, and ample leg room is provided for both. The Millford Empress is another model which is not only very handsome, but also extremely substantial. The chassis is underslung, and the side members are reinforced by a triangulated framework, upon which

the wheel axle is carried. The handsomely finished coach-built body is supported on large C springs both back and front. Four-point attachment is used. A large locker is provided for spares, etc., under the seat. A point which has been improved for 1916 on all models is the attachment of the mudguard and valance, which can now be replaced in the event of serious damage without the necessity of also replacing the stays and clip. Also the shackles (which we illustrate) have received attention, and are now designed to overcome any tendency to rattle.

Mills-Fulford, Ltd., Crown Works, Stoney Stanton Road, Coventry.

## The Spider.

This is a sidecar specially built for use with lightweight machines. The body is of wicker, and the back is upholstered, and is made so that the passenger can lie down. It also has a special pointed wind front, which offers little resistance to the air, and protects the rider to some slight degree. The weight of the body is 15 lb. The chassis, although light, is very strong, and is of the drop pattern, giving a low position. It is fitted with quickly detachable fastenings. Its weight is 45 lb. It may be had with 24in. or 26in. wheels, fitted with 1½in. or 2in. Dunlop

or Clincher tyres. It is especially suitable for lightweights or for medium-weight motor cycles, and for racing purposes.

Messrs. James Grose, Ltd., 4, Old Jewry, E.C.

## Holt Sidecar Accessories.

Messrs. Holt and Co. list a number of useful fittings for use with sidecars, a very handy one being the quickly detachable coupling for both the front and rear connections. These consist of the telescopic arm terminating in a taper and screw which fit into a corresponding socket attached to the down tube and rear stays of the cycle, the taper being secured by a large nut, the removal of which is all that is necessary to detach the connection. A special bolt fitting is also made for the saddle pin connection. These clips are made in about forty patterns and sizes. Other useful fittings sold by this firm are a stand for the sidecar wheel and a lamp

bracket for attaching to the off side of the sidecar chassis. In addition to these sidecar fittings another useful article consists of a trouser guard.

Holt Motor Accessory Mfg. Co., 13a, Kensington Road, Earlsdon, Coventry.

## The Hercules Sidecar.

The Hercules sidecar is a most elegant attachment. The chassis is formed by a complete loop of weldless steel tube, which is considerably dropped below the level of the axle and is also continued upward above the axle to form the supports upon which the springs for the

body are attached. The body, which is coachbuilt, is sprung both front and back, and is of a most pleasing design. Four-point attachment is used, and all the connections are quickly detached when necessary. A substantial luggage grid is fitted at the rear and folds up when not in use. A useful fitting is the rear stay of the mudguard, which forms a stand for the sidecar wheel.

The Hercules Cycle and Motor Co., Ltd., Conybere Street, Birmingham.

(Accessories continued on page 94.)

## MILITARY NOTES.

## MOTOR CYCLIST-AIRMEN. B.M.C.R.C. SERVICE MEETINGS PROPOSED.

## AN ACTIVE SERVICE PAPER.

WE have received a copy of the Bulletin of the No. 4 G.H.Q. Ammunition Park Sports Club. It is quite a lively little journal that sees the light every fortnight, being edited by Lt. D. H. Noble and Cpl. C. W. Cross. The former is the ex-Rover rider, and we have to thank him for the copy of the Bulletin. From the contents it is evident that there is plenty to do with one's spare time at G.H.Q., and football matches and cinema shows are going strong.

## POLICE AND THE M.M.G.S.

THE marked attention displayed by the police against military motorists in certain parts of the country is very lamentable. For instance, in the neighbourhood of the Motor Machine Gun Section training centre the police are very keen on hauling up, if possible, men of that section, and a few days ago we had the edifying sight of two men of the M.M.G.S. fined for not having properly illuminated identification plates on machines as supplied by the War Office!

## AIRMAN MOTOR CYCLIST MISSING.

SYDNEY C. HATHAWAY, who enlisted in the No. 5 (the Coventry) Battery of the Motor Machine Gun Service a year last November, and who three weeks ago came home for his kit, having been granted a commission in the R.F.C., is, we regret to say, unofficially reported killed. Sec.-Lt. Hathaway came home to Coventry at the beginning of the year, after nine months

of trench life with the M.M.G.S. He left again on the 7th inst., arriving at R.F.C. headquarters on the evening of the 8th. On the following Wednesday morning, the 12th inst., he acted as observer on an escort flight, and failed to return. At first it was presumed that observer and pilot had been taken prisoners, and a War Office notification to Mrs. Hathaway was to the effect that her son was "missing." A later note, however, stated that he was unofficially reported killed. Much sympathy is felt in Coventry for Mrs. Hathaway, as it will be recalled that it is only a few weeks ago that Mr. C. W. Hathaway, for many years works manager of the Triumph Cycle Co., died suddenly. There is a further irony in the fact that young Hathaway was to suffer misfortune so soon after he had been granted a commission in the R.F.C.

## A MOTOR CYCLIST IN THE NAVAL AIR SERVICE.

LAST week we had the pleasure of a call from Mr. Norman Lea, who is engaged in the Wireless Section of the R.N.A.S.

Since Lea's work consists in accompanying a pilot on a twelve-cylinder seaplane in reconnaissance work over the Belgian coast, he, as may be imagined, has some very entertaining experiences to record.

Lea is another of a large number of leading-motor cyclists who have enrolled themselves in one of the flying services; he sees no danger or particular excitement in his work! Of course, in this particular case special knowledge is needed, as all the time the observer is

busy "spotting" on the coast and sending messages by wireless back to the carrier-boat and also to other seaplanes in the vicinity. Twelve cylinders sounding somewhat of a maze, we asked Lea how many cylinders of his Sunbeam engine could be missing and the seaplane still continue to fly at speed, and were surprised to learn that, even should one cylinder cut out, nothing like the usual speed could be attained, and would quickly necessitate a stop for adjustment.

It may be mentioned that the sparking plugs are never left in the cylinders, but are regularly removed at the end of a run, and only put back into position again just before commencing a flight. This is to prevent moisture forming on the points.

One very exciting incident of Mr. Lea's career was an occasion when, returning from Zeebrugge and Ostend, they found themselves above a big bank of fog, which totally obscured everything. Continuing for some time in this manner, hoping for the mist to pass, a descent had at last to be made to find their bearings, but the plane was lower than the pilot imagined, and they reached the sea much more suddenly than desired, the sudden impact resulting in damaged floats and other parts, and there was nothing to do but drift about and wait for assistance. The sea was choppy, and both pilot and observer were wet through, and in this state they remained for several hours before they heard the bell of a collier. Yelling their hardest they were lucky in being heard as they drifted rapidly past the collier, and a boat was dropped and the men picked up. They managed to save their seaplane, and were subsequently picked up by a destroyer. Next day, after sundry repairs, they were able to fly back to the base.

## B.M.C.R.C. RACE MEETINGS IN 1916.

WE have lately been in conversation with the honorary secretary of the B.M.C.R.C. concerning the advisability of running a series of three race meetings at Brooklands during the coming season. He has gladly fallen in with our suggestion, and every endeavour will be made to run the Naval and Military motor cycle race meeting in April, the Allied Forces meeting in June or July, and the Navy and Army meeting in August or early in September—all open to any officer or man in uniform of the British or Allied armies and navies.

Readers will remember how successful were the last two meetings organised in 1915, and it is hoped to make similar events even more successful in 1916, when it is likely that the track will be in a far better condition. Officers and men at naval and military stations, where there are numerous motor cycles in use, are urged to give every assistance to obtain the requisite number of entrants. Any communications concerning the meetings should be addressed to, and any suggestions thereon will be heartily welcomed by, the honorary secretary, Mr. T. W. Loughborough, 83, Pall Mall, S.W.

## SUITABLE RECREATION WITH THE M.M.G.S.

Sgt.-Maj. E. Hackett (driving) and Gunner Macdonald, both of the M.M.G.S., who derive great pleasure from the latter's Grand Prix Morgan, which is kept at the training centre in the South of England. Macdonald came up by road on the Morgan from his home at Ely, Cambs, to enlist at Coventry.

# The 8 h.p. Twin-cylinder Reading Standard.

85 mm. × 95 mm. (1,078 c.c.); Three-speed Gear Box.

ONE of the most practical American motor bicycles recently introduced into this country is the 8 h.p. Reading Standard. The general appearance is distinctly pleasing, and the machine presents several attractive features.

Contrary to the usual American practice, the engine is provided with side by side valves, and in general design closely resembles English productions. The tappets are adjustable, and the distribution gear comprises several points of interest. The timing gear wheels are of large dimensions, and cut integrally with them are the cams, which are of large size, there being one on either side of each of the two larger timing wheels, of which the outer actuates the inlet and the inner the exhaust. The tappets themselves are lifted by means of rockers interposed between them and the cams, while between the two exhaust rockers is a double cam, which is the internal exhaust lifter. On the lower of the two intermediate wheels which drive the magneto is a worm spindle driving a small plunger pump, which keeps a constant level of oil in the crank chamber. All the timing wheels are marked, so that in the event of the timing being deranged it is very little trouble for the owner to reset it correctly. At the base of the crank chamber there is a window, in which the level of the oil may be seen. The oil is delivered from the rear compartment in the tank to the pump, and thence to the lower part of the crank chamber, but there is also a hand pump on the other side of the machine, which conducts the oil to another part of the crank case. On the rear side of the machine there is a release valve, above the timing gear, at the end of which there is a long pipe for the purpose of conducting away any excess of oil which would otherwise be deposited on the crank case.

The carburetter is the well-known Schebler automatic, situated midway between the two cylinders, and attached to a short induction pipe. The design

Valve side of the 8 h.p. Reading Standard—the latest American importation.

of the exhaust is quite good; the pipes are free from bends, and both lead to a

long exit pipe; they do not, however, enter direct into this, but issue into the extension through a short perforated tube, consequently the gases are well split up, and the result is silence and the absence of back pressure.

## Transmission and Gear.

We now come to the transmission. This is by chain throughout, chains of particularly substantial size—namely,  $\frac{3}{8}$  in. wide and  $\frac{5}{16}$  in. pitch—being employed. The gear box is of the three-speed sliding type, and the gears themselves and their shafts are of large dimensions. The gear ratios are 3.9, 6, and 9.2 to 1. Ball bearings are provided, and the shafts are withdrawable. A multi-disc clutch is fitted, which is actuated either by hand or foot, and there is an interlocking device inside the gear box, which prevents the gear lever being shifted while the clutch is in engagement. This consists of a D-shaped bar, which when turned wedges up against the striking lever and prevents it being moved. The front chain is provided with a half chain case, while a chain guard extends over the rear chain.

The footboards, which are 16 in. long and 4 in. wide, can be made to fold up, and give the rider ample room for an occasional change of position.

At present only one brake is fitted, but future models will be provided in addition with an internally expanding brake working inside the existing drum.

The engine is set in motion by means of a substantial kick starter of the gear and sector type. In the model demonstrated to us, the pedal is on the near side of the machine, but there is nothing to prevent it being placed on the off side. The whole of this mechanism was most substantially constructed, and the pedal, which is rubber-covered, can be swung out of the way when not in use.

The frame is an excellent piece of work, of a symmetrical design, which allows the top tube to curve downwards at the rear, and continue in a straight line to the rear forks, which is certainly

Showing neat design of front forks and handle-bars.

Left-hand side of the Reading Standard showing transmission, which is all chain with a countershaft three-speed gear box.

**8 h.p. Twin-cylinder Reading Standard.—**

an attractive feature. It is constructed of heavy tubing reinforced throughout, and drop forgings are employed where the frame is subjected to severe stresses, while sidecar connections are built into the frame. The saddle position is only 30in. from the ground, which is a feature that should be much appreciated. This saddle is provided with enclosed springs, and a spring seat pillar is also fitted. The spring forks are of neat design, and should be effective, the bearing surfaces being large and the springs being totally enclosed.

Every part of the Reading Standard, except the carburetter, clutch, and magneto, is made throughout at the company's workshops at Reading, Pennsylvania, U.S.A. Points of convenience have been well studied. The luggage carrier is substantial, and so is the stand, while between the saddle tube and rear mudguard is a capacious metal tool box. The mudguarding of the machine has been well thought out, the mudguards being wide and substantial. Altogether

Timing gear of the twin-cylinder Reading Standard.

the Reading Standard is one of the few recently imported American machines, which really conforms to British ideas. It is, of course, an ideal sidecar mount, and we are looking forward to a comprehensive trial of it on the road at no distant date.

The control is by twist grip and Bowden wire, but contrary to the usual American practice the exhaust lifter is independent and works direct. The machine is handled in London by the Reading Standard Co., 28, Baker Street, W.

## SCOTT PATENT CLUTCH AND GEARBOX.

**A Compact Friction Clutch.**

This clutch has been designed to obtain a construction which is extremely narrow and compact. The clutching action is that of expanding a split ring

A against the interior surface B of the flywheel. Two sectional views are shown, these being taken on different lines to show the complete internal construction. The flywheel is attached to the engine crankshaft as usual, and revolves continuously therewith. Rotating on the hub of the flywheel is a gear wheel C from which the power is taken off to the road wheels. This gear wheel is bolted up to a disc D with which is connected the expanding clutch ring A. The parts A and D rotate always together, and they constitute the driven member of the clutch. Expansion of the split ring A is effected by means of a sliding cone E, which engages a similarly conical surface on the interior of the split ring A. The cone E is pressed to the left by the springs F, which bear, at their left-hand ends, against a gear

wheel G attached by bolts to the sliding cone E. The bolts pass through holes in the web of the flywheel, so that the flywheel and sliding cone E always revolve together, and when the clutch is released the split ring A is expanded and gripped between the cone E and the rim of the flywheel. One face of the gear wheel G is provided with a thrust plate H, and against this operates the clutch pedal or the like, which presses the cone E to the right. The gear wheel G drives the magneto, and is made slightly wider than the gear which meshes with it, causing it to remain in engagement in spite of its sliding action. —A. A. Scott, No. 1,291, 1915.

**A Three-speed Gear Box.**

The larger view is a sectional elevation of the gear box, the driving-shaft A being arranged directly over the layshaft B. The drive passes to the former from a spur gear wheel C. Free to slide but not rotate upon the driving-shaft is a spur pinion D provided with clutch dogs E, and gearing with a spur pinion F on the layshaft. The layshaft also has fixed upon it further pinions G H engaging corresponding pinions J K free to slide upon a sleeve

L, which takes a bearing on the driving-shaft, and at its right-hand end is coupled up to a universal joint M, by which the drive is taken from the gear box. The pinions J K are provided with clutch dogs N O adjacent to similar dogs on the ends of the sleeve L. The pinion D is formed with a groove

P, and the pinions J K with projections Q, the groove P and projections Q being engaged by gear shifting rods R S seen in the smaller view. Sliding of the rods R S in order to engage the respective dog clutches and obtain the required changes of gear is effected by a cam T. The bosses of the rods R S are mounted on a shaft U, and each boss carries a roller V engaging the periphery of the cam T. The bosses are connected by a spring W tending to draw them inwards. Thus, when the cam T is rotated by its control lever (not shown) into a position in which the recesses come under the rollers, the latter are drawn inwards by the spring W, and the gear shifting rods R S moved as required. In order to prevent damage to the gears and clutch dogs, the cam T is attached to a plate X provided with recesses Y engaged by a locking plate. This plate may also be connected up to the clutch actuating rod.—A. A. Scott, No. 1,293, 1915.

## Bristol Motor Cycle Club.

Of the members of the Bristol Motor Cycle Club thirty-two are now in His Majesty's Forces. At a recent meeting it was decided that a committee of three should select a suitable place for the new headquarters, as the Queen's Hotel, the present headquarters, is to be closed on February 1st. Mr. A. Stevens was elected honorary secretary *pro tem.*, owing to the sudden resignation, due to the pressure of business, of the honorary secretary, Mr. F. P. Wasley. With regard to competitions for 1916, it was decided that the matter should be left over until the next meeting, but it was hinted that an open trial at Easter for military motor cyclists or those wearing armlets would be an interesting and desirable fixture. The secretary would be obliged if the following gentlemen would communicate their addresses to him, so that awards due to them in the open trials held in January and April, 1915, may be forwarded: G. E. Radley, C. Holland, C. Norrington, G. O. Scrampton, H. Walker, C. Percival, A. J. Dowler, and E. R. Troward (Lt.).

## SPECIAL FEATURES.

SIDECARS AND ACCESSORIES  
(Over 130 Illustrations).BREAK HILL-CLIMBING IN THE PEAK  
DISTRICT (Illustrated).

## Lamp Discs Free.

The Automobile Association and Motor Union are issuing free of charge to any motorist member or non-member perforated discs for dimming lamps to comply with the new lighting regulations. In applying for discs to Fannum House, Whitcomb Street, Coventry Street, W., diameter of the lamps must be given.

## Is a Tax Necessary?

A fine point has arisen in connection with the tax on the P. and M. motor bicycle and sidecar used by the performing seals and juggling sea lions in Capt. Woodward's stage performance. Considering that the gear ratio is  $2\frac{1}{2}$  to 1, there is little chance of it being used on the road, but as it has to be moved from one variety theatre to another this fact alone seems to necessitate the taking out of a licence.

## The M.C.C. Annual General Meeting.

The annual general meeting of the Motor Cycling Club will be held at the Café Monico, Piccadilly Circus, W., at 6.30 to-night, to receive the annual report and statement of accounts. The report has little to record, and the accounts show a considerable fall in revenue, which is only natural, seeing that yearly subscriptions have been reduced from 21s. to 5s., and Service members have been exempted altogether. To preserve the financial position of the club, the executive have purchased £400 of War Loan stock.

## Never Seen in the Air.

A good story was told by Mr. Arthur Butterfield in a lecture at the Birmingham Rotary Club on the 17th inst. on "The Simplicity of a Two-stroke Motor Cycle." Speaking of a trial of a Levis engine for aeroplane work, he said: "We got cleared off our pitch at the Castle Bromwich Aerodrome, after getting the first machine ready to test for flight, when the war broke out. Then, to complete our disgust, before moving the machine away, one of the onlookers asked me why we had painted the rudder plane such a funny colour. I explained that that was an invisible blue, a sky-blue tint which rendered the machine more difficult to discern when in the air. He remarked, 'Ah, I might have known that that thing will never be seen in the air.'"

## A Stolen Machine.

A second-hand Sun lightweight has been stolen from a Chester garage, and a reward is offered for information leading to its recovery by Messrs. Marstons, 26 and 31, Bridge Street, Chester. It is a single-gear 1914 model, black frame, black and gold-lined tank. The aluminium cover for the magneto chain was missing, and the registration number was OM 684.

## A Motor Cyclist Corps in Africa.

A daily press telegram states that a Motor Cyclist Corps is being formed in South Africa for service in East Africa. We await further details, but we have no doubt that the decision will greatly please South African riders, a great number of whom have made the journey home to England at their own expense specially to enlist in the different motor cyclist sections of the British Army.

CLIMBING THE WINNATS PASS, DERBYSHIRE.

Further photographs and particulars of a hill-climbing expedition on the severe ascent will be found on page 89 of this issue.

**The Sutton Coldfield Automobile Club.**

Of the many members of the Sutton Coldfield Club serving in His Majesty's Forces we regret to note that three have been killed in action since the commencement of war. They are K. H. Clarke, G. Patterson, junr., and H. G. Turner.

**The National War Funds.**

At the week-end the principal war funds stood as follow:

The Prince of Wales's National Relief Fund (£2,893,000 distributed) .. .. .	£5,719,462	0	0
The Times Fund for the Sick and Wounded .. .. .	3,156,333	0	0
The Weekly Dispatch Tobacco Fund .. .. .	97,549	16	9
The Queen's Work for Women Fund .. .. .	168,280	19	7
The Belgian Relief Fund .. .. .	1,325,000	0	0

**Promotions.**

ARMY SERVICE CORPS.—Temporary Sec.-Lt. E. A. Burney to be Temporary Lt. E. A. Burney is well known to our readers as a competition rider, and was formerly one of the directors of Messrs. Burney and Blackburn.

Sec.-Lt. (Temporary Lt.) to be Temporary Capt. M. G. W. Burton. Capt. Burton was formerly secretary of the Cambridge University M.C.C., and was one of the organisers of the most successful Inter-Varsity Race Meeting held at Brooklands about eighteen months ago.

**Lincolnshire A.C.**

Satisfactory support for the scheme for mobilising local motorists under the title of the Lincolnshire Volunteer Motor Ambulance Transport Service was reported at the annual meeting of the Lincolnshire Automobile Club held at Lincoln on Friday under the presidency of Sir Hickman B. Bacon, Bart. The scheme, it was stated, had received one donation of £20, and under the organisation of Mr. A. E. Brunning 372 cars and 314 motor cycles were now on the register. The car owners were split up into thirty-two sections, distributed throughout the county, each with motor cycle despatch riders. When completed the scheme would permit of a quick concentration of ambulances at any given point under the control of the Red Cross Society. Many members were doing military duty, and the committee have decided to remit the current subscriptions for members serving abroad. Despite inevitable losses through the war, the membership was 314.

**D.R. Recruits and Group System.**

The recruiting position, so far as it affects R.E. despatch riders, is made clear in this issue.

**Mr. R. H. Lea.**

Accompanying Norman Lea (an interview with whom appears elsewhere in this issue), when he called on us at the end of last week, was his father, Mr. R. H. Lea, sen., director of Lea-Francis, Ltd., who met with a bad accident as a result of a collision last summer. We were glad to note that he is making good progress towards complete recovery.

**Maux Boats on War Service.**

Numerous readers of *The Motor Cycle* who have crossed to the Isle of Man will be interested to hear that the turbine steamer formerly known as the *Viking* is now doing yeoman service under another name in H.M. Navy, while another Maux boat is engaged in mine-sweeping.

**An Ingenious Variable Gear.**

Students of design must have been much interested in the variable gear described in our last issue, the invention of Mr. C. H. Ingall, the designer of the Lea-Francis motor cycle. This gear gives an infinite number of variations between the solid top gear and zero; it also provides a reverse. Though possibly, more suited to a light car, in the form shown in our illustration, with certain modifications, it should prove an ideal gear for a motor cycle.

**Help for Disabled Riders.**

As showing the representative character of the meeting held at the R.A.C. last week to consider the formation of a central body to look after the interests of disabled motorists, the following list should be noted:

Royal Automobile Club.  
A.A. and M.U.  
Auto Cycle Union.  
Commercial Motor Users' Association.  
Society of Motor Manufacturers and Traders.  
Motor Trade Association.  
Cycle and Motor Trades Benevolent Fund.  
National Traction Engine Association.  
Associated British Motor Manufacturers.  
National Society of Chauffeurs.  
Imperial Motor Transport Council.

A central committee has been formed which will devote itself to providing employment for those disabled men who, prior to enlistment or during the war, were engaged in any capacity connected with motoring. The subject is referred to in a leading article in this issue.

**Engineer and Athlete.**

The managing director of the British Harley-Davidson Co. is now Mr. Duncan Watson, I.E.E., who is the sole proprietor of Messrs. Duncan Watson and Co., electrical engineers, Messrs. Berry, Harrison, and Co., and Messrs. Roger Dawson, and chairman of directors of Opel Motors, Ltd.

Another addition to the board is Mr. John Withers, of Messrs. Withers, Birkett, and Davies. At Cambridge he was captain of his college boat, and for some time hon. secretary of the Alpine Club.

**Average Prices.**

We give below the average prices of second-hand models offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model the average for the past week is quoted. If there were not at least two advertisements, then the last occasion on which they were quoted is given.

**A SPORTING DESIGN LIGHTWEIGHT SIDECAR.**

Canoet Minor coachbuilt lightweight sidecar, the body of which weighs, upholstered, only 25 lb. It is so light that a man can support it on the palm of the hand. Canoet sidecars are referred to on page 80 of this issue.

## MECHANICAL HORNS.

The divergency in the design of the growingly popular mechanical warning device is not generally appreciated. The drawings and descriptions accompanying will interest those who take a delight in knowing "how the wheels go round."

**T**HE amount of ingenuity displayed by designers in producing a warning note by means of a mechanical horn is quite astounding. *The Motor Cycle* was the first journal to go to the trouble of taking each one of these horns to pieces and having the interior sketched for the benefit of the motor cyclist. The average motor cyclist is nothing if not practical, and he dearly likes to know how any piece of mechanism on his machine works. When the various designs are compared a very clear idea may be gathered of the different methods employed in producing the sound. In almost every case the sound is produced by causing the teeth of a cog wheel to rotate against an adjustable point in the centre of a diaphragm placed immediately behind the bell mouth of the horn, but variety is to be found in the different methods used to drive the actuating cog wheel.

Let us take, for instance, the **SPARTON HORN**. In this case the lever outside drives an Archimedean screw, which

causes the cog wheel to revolve at a rapid rate. The mechanism of this horn is extremely simple. (Messrs. Brown Brothers, Ltd., 15, Newman Street, Oxford Street, W.)

**THE GLORIAPHONE.**—The mechanism of the Gloriaphone is easily followed. The lower part of the plunger rod is cut so as to form a ratchet, and works in a slide

in which there is a spring to return it to its original position after it has been depressed. This ratchet engages with threads cut on a spindle turning at right

The Long horn referred to below.

angles to it, on which there is loosely mounted on a ratchet a large tooth wheel which engages with the contact point on the diaphragm of the horn. The object of the ratchet, of course, is to allow the plunger to return to its original position after the horn has been operated. One of the peculiarities of the Gloriaphone is the absence of a bell mouth, yet despite this it makes plenty of noise. (Messrs. Etienne et Cie., 42, Gray's Inn Rd., W.C.)

We now come to the **LONG HORN**. This is actuated by means of a push-down lever, on the interior portion of which is a rack which drives a spur wheel attached to a larger wheel fitted with a ratchet. The noise is produced by means of a flywheel, on the face of which are regularly placed rollers which hit against the contact point situated in the centre of the diaphragm. This is quite a different principle from that employed in other horns. (Messrs. Markt and Co., Ltd., 98-100, Clerkenwell Road, E.C.)

The **SIMMS MECHORN** is of peculiar design, both internally and externally.

In this case there is a press-down lever on the outside to which is attached a rack which engages with a pinion on the cog wheel, which comes into contact with the diaphragm. (Messrs. Simms Motor Units, Ltd., 191, Wardour St., W.)

Interior of the Simms Mechorn.

**TAYLOR'S MECHANICAL HORN.**—In this the driving mechanism consists of a handle outside. Here, again, the interior mechanism is of simple design, a large

bevel coupled direct to the handle meshing with a small crown wheel, to which the actuating cog wheel is attached

(Messrs. H. Taylor and Co., Ltd., 21a, Store Street, W.C.)

Next comes a pattern which is slightly more complicated. This is known as the **HAND KLAXON**. Like the Long Horn it is provided with a push-down handle, in

**Mechanical Horns.—**

the lower portion of which there is a rack which engages with a train of highly geared wheels, which cause the teeth of the sound cog wheel to hit against the contact point of the diaphragm. Both this and the Long Horn belong to the same type, as the rapid depression of the plunger causes the wheels to rotate for some little time, with the result that a prolonged note is produced in this manner. Yet another interesting feature is the lubrication system, as a squirt of oil given through the lubricator finds its way into a cup, whence it reaches, by means of pipes, the three principal bearings. (Messrs. The Klaxon Co., 1, King Street, St. James's, S.W.)

**THE DUNHILL.**—Curiously enough, the Dunhill mechanical horn works on very much the same principle as the Spartan, in which an Archimedean screw is em-

ployed on the diaphragm. A spring is employed to return the handle to its original position after being depressed. (Messrs. Alfred Dunhill, Ltd., 359-361, Euston Road, N.W.)

The STEWART HORN is an excellent one of very much the same type as the Klaxon, and in this also a train of wheels is set in motion by pressing down a rack, while the sound is produced in very much the same manner as in the Klaxon. In all the horns under review the note can be to some extent varied by adjustment of the contact point on the centre of the diaphragm, and to facilitate this the manufacturers of the Stewart supply a special tool which greatly aids this operation. In the case of some horns the whole bell mouth portion has to be removed before adjustment can be effected. (Messrs. The Cooper Stewart Engineering Co., Ltd., 11, Broad Street, Bloomsbury, W.C.)

A study of these horns is by no means uninteresting. The leader, of course, was the electric Klaxon, which produces much the same effect by means of an electric

motor. The original Klaxon, however, has been unrivalled as a road clearer, but such a system would be unwieldy on the average motor bicycle, consequently the mechanical horn has proved to be a very good substitute. No one can say that the noise it produces is calculated to promote good feeling between the motor cyclist and the pedestrian, though the latter may often be glad of its existence. He is a curious person, is the pedestrian. He hops out of the way and glares at you angrily after trying to throw himself under your front wheel, and yet, had it not been for the raucous note of the mechanical horn, he would probably have been rolled into the gutter. The note the mechanical horn produces is raucous and penetrating, and it owes its popularity solely to the fact that it can be heard a long way off, and above other street sounds in dense traffic. Many are now being used by both Navy and Army throughout the country, and their penetrating sounds may be heard calling road users to make way in "the King's name."

ployed. On the handle being depressed, a threaded arm passes down the Archimedean screw, causing the drum on which the teeth are cut to revolve rapidly, these in turn come in contact with a

The Stewart mechanical horn.

## Royal Engineers (Signal Section).

### Central Office Announcement concerning Recruiting of Despatch Riders.

TO obviate the difficulties and unfairness which were inevitable under the old system of recruiting motor cyclists for the Royal Engineers, and in order to ensure that all qualified men should have a fair opportunity of enlisting in the Motor Cyclist Section R.E. throughout the United Kingdom, instructions have been issued by the newly constituted Central Offices, of which the following is an extract:

"Every man examined and found to be qualified for registration on a waiting list should be attested and passed into the Reserve (Group System). Such men should be supplied by the secretary of the local Motor Cyclist Reserve Committee with a certificate stating that they have been approved as suitable candidates for the Motor Cyclist Section R.E., which certificate should be handed to the Recruiting Officer by the candidate at the time of attestation. The Central Office must be informed of the number of the group in which each man on a waiting list has been attested, and in allotting vacancies will include as far as possible all men of those groups then under notice

of joining. If any man receives a notice to join under the Group System before being called up by the Central Office, the M.C.R. Committee secretary should immediately advise the Central Office, and endeavours will then be made to enlist him forthwith in the Motor Cyclists' Section R.E. If for any reason this is impossible, the Central Office will communicate with the secretary of the local

M.C.R. Committee, requesting that the latter should apply to the R.O. to have the man relegated to a later group. The Central Office should be informed of the result of such application. Further, to assist the Central Office in allotting vacancies, candidates should be classified as regards (a) experience, (b) education, (c) physique. Instructions as to how to carry out this classification have been issued, and candidates of the three highest classes will be called up in preference to those of inferior classes, but only subject to the rule as regards taking men of early groups having been complied with.

#### Artificers.

"About one in ten recruits should be qualified to serve as artificers. Such men should have at least two years' experience in the motor cycle trade, and should be capable of undertaking turning, brazing, and fitting operations."

# Recruiting for the Royal Flying Corps.

## Trade-testing Men in Groups 2 to 5.

**L**AST week we published extracts from an official notice which had been issued by the Southern Command, respecting the requirements of the R.F.C., which extended to no fewer than 10,000 men. In it we mentioned that a special recruiting party of the R.F.C. would be in Birmingham from the 20th inst. with lorries and machine tools to trade-test the different men offering themselves. The information came into our hands on Tuesday, the 18th inst., and in our desire to assist recruiting, as we have done since the war—and even before the war by our "Military Motor Cycling Notes" feature—we gave details for the benefit of readers. Imagine our surprise, therefore, to receive on Friday and Saturday morning numerous letters from readers who, acting upon the paragraph, had gone to their local Recruiting Office, and had been informed, in several cases, that they knew nothing of the scheme. Birmingham men who went to their Recruiting Offices were

told that the R.F.C. party was certainly in Birmingham, but the only men required were those in Groups 2 to 5. (In the original notice these four groups were debarred.) We were not able to extricate readers from the confusion until the R.F.C. Officer in Charge at Birmingham telephoned to us stating that the instructions we reviewed, though admittedly official, had been countermanded, and that at present only men in Groups 2 to 5 were being tested in their different trades, with a view to being accepted for the R.F.C. This, we were told, applied to all England. The position then, at the moment, is that recruiting generally for the R.F.C. is closed for the time being, except for men attested in Groups 2 to 5.

On this page we publish photographs of scenes in connection with the R.F.C. trades-testing examination (including motor cyclists) now proceeding in Birmingham, of men in the Southern Command.

# Freak Hill-climbing in the Peak District.

FINE HARLEY-DAVIDSON PERFORMANCE.

A PARTY of Sheffield riders, all mounted on Harley-Davidson machines, visited a new test hill a few days ago in the Peak District. Winnats Pass, as it is known, is near Castleton and just off the main road from that place to Chapel-en-le-Frith, and, as the pictures show, it would come into the freak hill category. Nowadays it is only used as a footpath, but at one time it was part of the main road to Buxton. History has it that many years ago some bad miners murdered a young couple who were making their way up the pass on horseback and hid the bodies under the rubbish of the mine heaps in the immediate vicinity.

Although we are not able to give the actual gradient of Winnats Pass, the photographs reproduced show that it is a very tough proposition both as regards gradient and surface. The latter consists mainly of loose stones, and it is a credit to any machine to make a clean ascent. Eight amateur riders put in an appearance, and everyone got up without mishap—one with two passengers. Such a collective performance speaks well

for the hill-climbing abilities of the Harley-Davidson.

With hill-climbing competitions of the recognised nature tabooed owing to the war, trips of the type referred to are the only form of competitive recreation open to busy workers. On the occasion of the Harley-Davidson trip some temporary excitement was caused by a policeman objecting to the camera man, owing to the Defence of the Realm regulations or something of the kind. However, the good man was satisfied eventually.

Photographs taken during the ascent of Winnats Pass described on this page. The top one shows the policemen who objected to photographs being taken. The circle shows the rider, who took up the two passengers on the grass near the top.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

#### Auxiliary Cooling Devices.

Sir,—I was very interested in the article in *The Motor Cycle* of January 20th, and with regard to the subject of the first illustration I should like to make the following suggestion: Would it not be much better to replace the copper tubes by coils of copper wire or by spirals of flat pieces of copper turnings (like an Archimedean screw), because the radiating efficiency of such devices is much better than that of the copper tubing, owing to their having larger surface area per unit volume?

BERNARD E. HAWKINS.

#### Safeguarding Tank Stoppers.

Sir,—As the previous suggestion seemed to me a wee bit unornamental, I am sending you a little drawing which, from its age, commands respect; it is composed of a short length of chain threaded through the hole in the petrol or oil tank stopper, and a piece of stiff wire is attached to hang horizontally inside the tank; it must be slightly longer than the diameter of the orifice in the tank. This has the advantage of being out of sight, and enables the stopper to be usually attached to the tank, but yet readily detachable without the aid of tools.

G. A. EDWARD.

#### Decarbonisation.

Sir,—In *The Motor Cycle* last week your esteemed contributor "Ixion" quotes as part of his experience a single-cylinder motor on which he travelled 10,000 miles and removed the carbon twice in that distance. Also he quotes a hypothetical chain of circumstances wherein it would be possible to have a usable engine after 4,000 miles without decarbonising.

Now I have the privilege of having ridden most of the leading makes of motor cycles, principally of the single-cylinder variety, during the last eleven years, and for the last six years have averaged between 12,000 and 16,000 miles per annum. These engines have, with the exception of one make, required decarbonising at intervals of between 500 and 1,500 miles to ensure satisfactory running, the use of benzole in place of petrol tending towards the higher figure. The exception is the big 4 Norton machine, of which I have sampled two specimens for about 15,000 miles and 11,500 miles respectively. The first has been cleaned out twice, and the latter once. In neither case was the trouble of cylinder removal justified, as very little carbon indeed was present. The machines have had to withstand the vilest abuse, the first one being in continuous use on freak hills and congested traffic for gear testing purposes. The second machine is my own property, and is used mainly for long-distance fast runs (with sidecar, of course) over the hilly Peak District principally, the journey from Nottingham to Manchester (seventy-seven miles between termini) being usually made with three up in two and three-quarter hours. This is fast travelling when the traffic problem at each end is considered. At any time the bare hand may be held continuously on the cylinder, and it is to the cool running properties of this particular engine that I attribute its freedom from carbon deposit. No auxiliary cooling devices are in use.

The usual disclaimer.

J. COHEN.

#### Valve and Tappet Clearance.

Sir,—I have recently been overhauling my 6 h.p. twin, and, as I have had trouble with erratic firing of my front cylinder, I turned up "The Causes of Engine Stops" in December 9th issue of *The Motor Cycle*.

I am happy to inform you that I then discovered my trouble. I did not have sufficient clearance between the exhaust valve stem and the tappet. I noticed that the correct clearance was  $\frac{1}{16}$  in., but that  $\frac{1}{32}$  in. was not excessive in some cases. I therefore struck the happy medium, and sawed off  $\frac{1}{32}$  in. from the valve stem, drilling a new cotter hole and fitting a shorter and stronger spring.

I have now a perfect compression in both cylinders, and am anxiously awaiting the departure of winter so as to try this improvement on the road. TERRA NOVA.

St. John's, Newfoundland.

[Our correspondent's valve must have stretched in a most extraordinary way if cutting  $\frac{1}{32}$  in. off the stem gave the correct clearance! Evidently there is a mistake somewhere.—Ed.]

#### British Machines for British Riders.

Sir,—May I ("Penrot") be permitted a brief reply to "Wots Wright"? He describes his purchase of an American machine as "a fine service to my country," and this pitiful delusion is based on three alleged reasons. The first is a gross misstatement of fact, which, even if it were true, forms a *non sequitur* in his argument of more than usual imbecility. The second is the crux of the whole affair. He ought, if a responsible British citizen, to wait until the British manufacturer can give delivery of his order, and not to show the indecent haste for his new toy which appears to have been the deciding factor in his regrettable purchase. The third reason merely serves to show the hollowness of his contention. He must know that the tariff is primarily to prevent cash going out of the country, and not to raise revenue, and that the money raked in by the Exchequer is no compensation for the larger sum gone abroad.

These are "common facts of earth" patent to all but the most myopic egoists. If "Wots Wright" and those who share his views render many such "services" to their country, I think a few useful words might be written concerning them under the heading of your second leader in your last issue.

A. V. WRIGHT.

Sir,—I have read your correspondent's letter signed "Penrot." "Rotten Pen" would be a better name. It is commendable to boom one's own goods, but to publish such drivel about America, which is supplying all the Allies with the much needed ammunition and war supplies with an expedition unobtainable anywhere else, is another matter. Our workmen must be paid and materials paid for just the same as everywhere else. Our standard of wages is higher, and if you do not like it you should not order from us and then burst out in sickening emanations deserving of the waste paper basket.

DISGUSTED AMERICAN.

Sir,—I know very little of the merits or demerits of American machines, as I have always preferred to buy British-made to any foreign goods. My experience is, therefore, limited to British machines. I have, however, often wished that British manufacturers would turn out a machine with 28 in. wheels and 5 in. tyres for sidecar work; and,

while I sympathise to that extent with Mr. Cartwright, whose letter appears in your issue of the 13th inst., I think the attitude he takes up utterly deplorable. It is only now leaking out to what an appalling extent our trade in all directions had been captured by the unscrupulous methods of the Germans. Our eyes are now opened, and let us hope that German goods are damned for ever in the eyes of our countrymen. I do not suggest for a moment that our friends the Americans should be treated as our enemies, but I do suggest that no Englishman is justified in buying an American machine at the present time. And if a contrary view prevails to such an extent that American machines still continue to be sold in this country, I would urge the Government to treble the tax recently imposed.

"Penrot," in his letter in the same issue, uses strong language, but not a whit too strong. We are fighting for our very existence, and our markets must be preserved for our own manufacturers, whose reputations, as "Penrot" justly reminds us, were never higher than they are to-day. Why anyone should wish to own an American machine when there is such a galaxy of proved and tried British talent on the market I cannot understand.

OI1877.

[Both sides having had a fair hearing, this correspondence must cease.—Ed.]

### A Variable Jet Senspray Carburetter.

Sir,—I notice in your issue of January 15th a description of a handle-bar-controlled variable jet for a Senspray. I have had one in use since last July, and my experience fully bears out that of the writer of the article.

The slide, etc., closely follows that described, except that I use an ordinary Bowden single-lever control. As the writer says, it is very important to get the needle, etc., in line with the jet, so I think a method of doing this with certainty will be acceptable to your readers.

A piece of brass rod is placed in lathe-chuck, and turned down to a good fit in carburetter body where jet goes in. The carburetter body, divested of controls, is placed on this and the clamp tightened. A drill, slightly smaller than the required hole, is held in chuck in loose headstock, and a hole drilled in carburetter body. This is then opened out by means of a small boring tool to correct size. The next problem is to drill the hole in the spray tube for the needle. A small piece of brass rod about 1 in. long was turned to a fit in hole previously made, and a true hole of required size drilled up its centre; I used a  $\frac{1}{16}$  in. twist drill. This piece of brass is then sweated in carburetter in correct position, and used as a guide for drilling spray tube, of course using same size drill. By this means both hole in body and in spray tube will be found to be perfectly true with jet, and no trouble will be experienced in assembling. It may seem a rather troublesome method, but it is well worth it, and there is no danger of damaging carburetter, as might be done by haphazard drilling.

WALTER D. NEEDHAM.

### Some Fads and Fancies.

Sir,—I would like to thank Mr. R. E. Brown for his appreciation, and apologise for not answering sooner. My job here does not allow of getting *The Motor Cycle* every Thursday in time to reply the following week.

Our ideals are apparently in cordial agreement. Regarding Oildag, the vendors state that the small tin (1s. 6d. size) is sufficient for one gallon of oil. I have consistently used this quantity in half a gallon of Price's or Coolie. When an engine is new, a heavy dosing of Oildag, one small tin to a quart of oil, does an engine a world of good in my opinion. The effect on the running is most noticeable when coasting down a long grade with the valve raised. It gives the nearest approach to the silent glide one enjoys coasting down hill on a clutch machine.

Regarding the carburettors, I tried five or six different ones on this type of engine, and for fast touring I use the Senspray. For quieter running I use a three-jet Binks. The Senspray is my ideal as regards comfort of operation. The air lever can be practically a fixture from ten miles per hour to forty miles per hour. The longer throttle lever in the ultra T.T. position can then sit comfortably in the V angle between the thumb and first finger. A slight rotary movement of the hand anti-clockwise opens the throttle for a hill, and a reverse movement closes down

after the up grade has been surmounted. This is the great point about the Senspray for a fast machine; tap twiddling is reduced to a minimum. For an all-out burst the air lever is brought back and the throttle pushed out. The thumb can do all that. With a 38 jet, gear 4 $\frac{1}{2}$  to 1, my mileage varied from eighty-five miles per gallon in hilly Wales to one hundred and twenty miles per gallon in flat Lincolnshire. A 36 jet gave slightly better figures, but I always like the extra life and power on hills given by the extra .002.

I would like to suggest to Mr. Brown that he should lower his gear to 4 $\frac{1}{2}$  or 4 $\frac{3}{4}$  to 1 for ordinary touring. The 79 x 100 Norton engine can "rev." to some tune. He will be surprised at the increased liveliness of his machine, and road speed will not be lost. I shall be pleased to give any further information. A. LINDSAY (CAPT., R.A.M.C.).

### The Mysterious Sidecar.

Sir,—I have read Dr. A. M. Low's letter in your issue of January 13th with interest, and quite agree with what he says. I have ridden solo over one of the worst roads in Manchester on my new patent spring frame motor cycle, and found that absolutely no vibration is transmitted to the frame or rider. To test the machine further I attached an ordinary sidecar, and went out a seventy-mile ride over very bad roads, and found that the rigid wheel to the sidecar transmitted all the road shocks from the wheel to the motor cycle frame, and I could feel the vibration on the handle-bars. This proved to me that to make the perfect combination I must spring the sidecar wheel, and I immediately took out a patent for springing this in a manner similar to the motor cycle, and by this method I am hoping that I have solved the mystery of the sidecar problem.

GEO. E. RIGBY.

### Two-stroke Design.

Sir,—Mr. James Martin's article in your issue of January 20th gives a good deal of information about the theoretical operations involved in the transfer, compression, etc., of gas in a two-stroke. I am not competent to argue as to whether small throttle opening gives as a result a dense mixture of new and exhaust gases or a normal mixture as regards proportions but less dense. I should like to see it argued out.

The point that constrained me to write is that in order to enhance the value of his remedy he has altogether exaggerated the faults of the two-stroke, and his article to a novice would give the idea that it is a very faulty engine. I entirely disagree with the first two of his objections to a two-stroke, namely, (1) "coarseness in running" and (2) "tendency to four-stroke." The first I utterly deny. My two-stroke is far more flexible than any four-stroke I have ever ridden; the second, in a well-designed engine, is simply a matter of correct adjustment of carburetter. I would guarantee to run my Lewis for 100 miles any day at any speeds from 6 to 26 m.p.h. without once "four-stroking."

The third objection I agree with to a limited extent only. Careful adjustment and driving will give equally good results as a four-stroke, at any rate as regards petrol. I always get 120 m.p.g. The only single disadvantage I can find is that it requires decarbonising rather more frequently, but then again, this is such a very simple job for any amateur that it hardly counts against it, and certainly weighs very little against the real advantages of lightness, simplicity, reliability, longevity of tyres and belts, excellent hill-climbing, not to mention low first cost.

ROLYAT.

Sir,—May I be permitted to criticise a portion of the article in *The Motor Cycle* for January 20th re "New Design of Two-stroke Engines"? Part of this article reads: "When the throttle is open, say, one-fifth, then only a fifth part of new gas can enter the cylinder, and only one-fifth of exhaust gas is expelled." I admit that only one-fifth of new gas (petrol vapour) is admitted, but no vacuum is created, therefore the other four-fifths are air, this being sufficient to expel the exhaust. Continuing, "The piston has to go through another cycle and force in another one-fifth of gas before the mixture in the cylinder becomes rich enough to ignite." Now I maintain that as long as the throttle is open one-fifth the mixture is always of the same strength, viz., one-fifth gas and four-fifths air, and does not become stronger as the above suggests. Hoping to be enlightened on the subject.

NORMAN.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### An Unusual Accident.

[?]

My machine recently broke down on the road, and a passing car driver kindly offered to take it to the nearest town for me.

The help of two passers-by was obtained to lift the motor cycle into the car. While this was being done, the machine slipped and injured the hand of one of the passers-by. This man now claims damages from me, alleging that my negligence was the cause of the accident. I should wish to recompense him, but should like to know if I am legally liable.—R.H.W.

Our legal adviser writes as follows: "If the passer-by can really show that the machine did slip through the carelessness of your correspondent, he can certainly claim damages, but I should think he would have some difficulty in proving this. However, this is entirely a matter of evidence, and without full particulars, showing exactly how the occurrence took place, it is impossible to advise as to the position. What have the driver of the motor car and also the other passer-by to say, and are there any other witnesses of the occurrence?"

### Cleaning a Motor Cycle.

[?]

I want to know the best way to clean mud off my cycle, and at the same time preserve the enamel. The cycle is only six weeks old, but after the bad weather we have had lately it is coated with mud, and I want to give it a good clean and put it away for the winter.—F.S.

On no account should the mud be removed dry, as it would act like emery and scratch the enamel, spoiling the appearance. The best method is to soak the mud thoroughly with water, then remove it by means of a sponge and plenty of water, taking care to keep the water as much away from the bearings and magneto as possible. After removing the mud in this manner, the whole machine should then be cleaned thoroughly with plenty of paraffin. This will overcome the tendency to rust afterwards, and will preserve the enamel. If the machine is not to be touched again for the winter, it would be as well to paint all the bright parts with either vaseline or thick engine oil applied with a brush, and polish the enamel with a wax polish.

### The Warming of the Carburetter.

[?]

I am thinking of getting a two-stroke for short business trips in all weathers. I have been using a two-speed medium weight twin, and had a great deal of trouble last winter owing to the carburetter freezing on early morning trips in spite of additional warming. If I choose a two-stroke with the carburetter behind the cylinder, will it be better or worse in this respect?—J.T.H.

If the carburetter is placed fairly near the cylinder you should get no trouble from freezing. Naturally, if you have a long induction pipe, and if the carburetter is in an exposed position, this trouble occurs. We venture to think that if your carburetter had been really adequately warmed you would not have suffered from this trouble. The most satisfactory way of carrying this out in an air-cooled engine is to take a pipe from the main air intake and draw the air from a position close to the exhaust pipe, or, for preference, from a special chamber fitted up entirely enclosing the exhaust pipe.

### Fitting Dual Ignition.

[?]

I have a 6 h.p. twin-cylinder engine fitted with magneto ignition, and cannot get it started at low speed, so have fitted a coil and accumulator; this makes starting easy at slow speed. Is there any way of fitting the engine to work with both magneto and accumulator ignition, so that I could start up on accumulator, then run on the magneto? At present I have taken off the magneto, and am working with a four-volt accumulator and two single trembler coils. Is this correct? It seems to work all right, and gives a fine spark. I shall be pleased to have your advice, as I have had the magneto examined and put in thorough repair, and still I have difficulty in starting up.—J.F.

Unless you can fit two plugs in each cylinder you will have to fit a high-tension switch, which would not be worth the expense or trouble of installing. The machine, if properly adjusted, should start quite easily with the magneto. You will have to see that there is an efficient spark, and if so we can see no reason why you should not start easily from cold. Take care not to have your

plug points too close together, as too close a gap causes a feeble spark, whereas with a wider gap, say, up to .75 mm., the current has to make a greater effort to jump the distance, and consequently a more effective spark is produced. The contact points should be adjusted to separate .4 mm. by means of the magneto gauge. Always have the spark fully advanced, as a magneto gives the most efficient spark when in this position. You should also take care to see that there are no air leaks at the carburetter or induction pipe unions. What you need for easy starting is a strong mixture and little of it.

### Charging Accumulators.

[?]

I have lately acquired a 1914 7 h.p. Indian with electric equipment. I have heard it is possible to charge accumulators from the public lighting supply by interposing lamps to reduce the current. If it is feasible to charge the lighting accumulators on a 200 volt circuit, will you please tell me how many lamps of each of the following candle-power would have to be used: 25, 50, 75, and 100 c.p.? Could you also give the approximate cost?—B.H.C.

You get, roughly, 1 amp. for each 50 c.p. lamp in circuit, so one lamp would be sufficient to charge, but if you wish to charge more rapidly you may insert as many as three and charge at 3 amps. or more, according to the number of lamps inserted; but this should be regulated by the charging rate of the cells, which should be marked on the side. You can only charge from the main if it is continuous current. It is an expensive method of charging unless the lights are being used in any case. The fact that the accumulator is inserted makes very little difference to the strength of the light. You can connect the accumulator to the switch controlling the necessary number of lamps, taking one wire from each terminal of the switch and connecting the positive wire to the + of the accumulator, and — wire to the — of the accumulator, taking care that the switch is in the off position, otherwise you will short the accumulator, as when charging in this manner the accumulator takes the place of the switch. You can find out which wire is which by dipping them in a little vinegar and water, when bubbles will appear on the negative wire.

**SPECIAL NOTICE.**—Copies of "The Motor Cycle" may only be sent to neutral European countries if posted direct from the offices of the publishers, or by agents who have obtained permission from the War Office for this purpose. The publishers of "The Motor Cycle" have obtained the necessary permission, and, consequently, can send subscribers' copies as usual. Before sending through newspapers it is important to enquire if permission has been obtained as otherwise copies intended for neutral European countries will not be forwarded by the Post Office.

**Failure to Climb Hills.**

I have a 1914 8 h.p. water-cooled sidecar outfit, which I find very satisfactory on the awful Welsh roads over which I have to travel because of its weight and strength. One thing, however, troubles me. I have to climb a rather steep hill on leaving my house; it is quite short, but has about 100 yards with a gradient of from 1 in 4 to 1 in 5. The surface is not bad, but very slippery in wet weather. I cannot get the combination up this hill with a 10-stone passenger in the sidecar (my own weight is 10½ stones) on its low gear of 9 to 1. I may add I am not an inexperienced driver, as this is my eleventh machine. When the weather is inclined to be cold I notice hoarfrost on that part of the induction pipe which is nearest the carburetter, and when this occurs the engine pulls rather sluggishly, and I very often have to close down the air lever of the carburetter to stop misfiring. This is because of the long induction pipe, I suppose. I am using a 33 jet. The engine is in first-class order. (1.) Should this machine be able to take a passenger up the hill mentioned? (2.) Would the frosty induction pipe have anything to do with it not going up, or cause loss of power; if so, which would be the best way to warm it? (3.) What is the smallest tyre I can fit to the driving wheel of this machine with safety? (4.) What speed should I be able to get?—W.L.T.

The running of the engine would be considerably improved by the fitting of a warming pipe—that is, a pipe fitted to the fixed air inlet of the carburetter and brought close up against the exhaust pipe, so that the engine draws in warm air; failing this, a carburetter with a hot air or water jacket would be desirable. (1.) The machine should take a passenger up the hill mentioned when the engine has got thoroughly warm, but you would probably require a gear of 10 or 12 to 1. (2.) Undoubtedly the pulling is affected by the frozen carburetter and induction pipe. (3.) The smallest tyre we should advise for this machine would be a 3in. (4.) About 45 m.p.h. maximum.

**Moisture on Magneto.**

Could you kindly give me advice as to how to rectify the following trouble? My machine is a 1914 3½ h.p., and during the recent wet weather I have either not been able to start the engine or have had to run about 100 yards to do so. Eight weeks ago the makers of the magneto supplied a new contact breaker. The other day nothing was apparently wrong, but I could get no spark. The magneto (armature, make and break, etc.) has since been thoroughly cleaned, and a good spark obtained, but there is still a great difficulty in starting. The platinum points are correctly set, also the plug points, and I have thoroughly cleaned the Senspray carburetter with paraffin, and tried two different jets. On the day before the trouble started I fitted a zinc mudsplash to the bicycle. This does not touch any terminal of high-tension cable or plug, but is as near as ¼ in. to the magnets. Could this possibly affect the ignition?—E.E.P.

The trouble is possibly caused by moisture condensing either on the magneto or on the plug or high-tension wire. You should make sure all parts are perfectly dry, especially the high-tension wire and carbon brush and holder. In damp weather the rocker arm in the contact breaker is very liable to stick owing to the fibre swelling with the damp. You should make sure this is working quite freely. Cleaning the carburetter with paraffin is likely to do more harm than good. In cleaning a carburetter all that is necessary to do is to loosen any particles of dirt or fluff which may have collected and rinse out with clean petrol. Do not push anything through the jet to make sure it is clear; blow through it with the mouth or by means of a cycle pump. The zinc cover would not cause any trouble unless it was touching either the high-tension terminal or the contact breaker terminal; simply being near or touching the magnets would have no effect. If you suspect damp in any part it would be as well to store the machine in a warm room, but not near a fire, when the condensed moisture would be evaporated. Do not

flood the carburetter too freely before starting. To start, close the air lever, and do not give more than a quarter throttle opening. Try a new plug, the old one may be faulty.

**Misfiring.**

I shall be obliged if you will kindly give me your advice with respect to the following matter: I have a 1914 T.T. Douglas which has run splendidly until about a fortnight ago, when I took off the cylinders and ground in the valves. The trouble is that the machine ceases to fire in the front cylinder at speeds about 12 m.p.h. or under. The engine is fast when the throttle is opened, and fires in both cylinders. I am using a No. 24 Amac jet; a No. 26 improves the firing at slow speeds, but the engine is not by any means as fast as with the 24 jet. I have tried the plugs in each cylinder, and there appears to be a satisfactory spark. I am certain the trouble is in the front cylinder on account of it remaining cooler than the back. The valves are free in their guides, and there is sufficient clearance between the valves and the tappets.—H.B.

The trouble is probably due to an air leak in the induction pipe. See that the induction pipe nuts are sufficiently tight, and be quite sure that the valve clearances are equal in every case, and that all the valves are seating correctly; also make sure that the plug of the cylinder that is giving trouble is in good order, and the points adjusted to the correct distance, viz., about ⅜ in.

**EXPERIENCES WANTED.**

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

“A.C.R.” (Middlesex).—Grado Multi pulley on 2½ h.p. twin.

“C.R.C.” (Bristol).—2½ h.p. Peco and sidecar. Load carried, gears used, consumption, and reliability.

“F.P.” (London).—Binks spirit for Scott. Power, consumption with sidecar, effect on engine, and general efficiency.

“R.L.” (London).—Binks carburetter on a 5-6 h.p. single-cylinder engine, which now goes best at high speed.

**RECOMMENDED ROUTES.**

GRAVESEND TO ALLINGTON.—H.C.

(Left) Triumph-mounted despatch riders attached to a lorry convoy. The one on the right has a sidecarrier attached.

(Right) A few N.C.O.'s with a Rudge.

## TYRES AND CLOTHING.

Novelty is less pronounced in this section. Nevertheless many useful and novel designs of non-skid tyres and highly practical garments for motor cyclists are dealt with. The suitability of motor cycling apparel in warding off cold and wet is proved by the fact that covering originally designed for motor cycling is being largely used by the Army for trench wear.

### Rom Tyres.

When one mentions combination rubber and steel treads Rom tyres are instinctively thought of, as the Rom Tyre and Rubber Co. were practically the first manufacturers to make this type of cover, which has become so popular among motor cyclists for both winter and summer riding. As most of our readers know, the combination non-skid is composed of rubber bars alternating with steel studs. The idea is that on wet and greasy roads steel studs make the ideal

Rom rubber non-skid.

Rom combination tread.

non-skid, whereas in dry weather the rubber non-skid is to be preferred; the combination tread, therefore, makes an excellent compromise. Besides the popular combination cover the Rom Co. also make a rubber-studded pattern the studs of which are of square section. This cover is sold at a moderate price, which renders it an attractive proposition. A pattern similar to the combination cover is also sold, but minus the steel studs, and forms a hard-wearing cover. Rom tyres have been used extensively on the motor machine gun sidecars at the Front.

The Rom Tyre and Rubber Co., Ltd., 36, Brooke Street, Holborn, London.

### The Gamage Tyre.

The Gamage tyre is a particularly well-made article, and is of the ribbed pattern, which forms a most efficient non-skid.

Two varieties of the Gamage ribbed cover.

There is ample thickness of rubber in the tread, while the casing is specially strengthened by many layers of the best quality canvas.

Messrs. A. W. Gamage, Ltd., Holborn E.C.

### Dunlops.

The chief novelty that Messrs. Dunlops have produced for 1916 is a rubber-studded beaded edge cover for light-weight machines, made for 24in. and

26in. wheels, and of 2in. and 2½in. section. The tread is a combination between the grooved and studded patterns, and is efficient against skidding. An interesting tyre is the combination

rubber type, specially designed for passenger work, made for 26in. wheels, from 2½in. to 3in. section, also for 650×65 mm. voiturette rims, and in the 700×80 mm. size.

Messrs. The Dunlop Rubber Co., Ltd., Aston, Birmingham.

### Clincher.

An interesting pattern of Clincher tyre is known as the De Luxe, which is a substantial cover in which the tread is composed of studs joined by ribs forming a

Clincher De Luxe cover.

Clincher combination tread.

curious star pattern; it should be efficient as a non-skid until worn down. The rubber has been changed from grey to a tough white quality, and has been considerably improved in durability, since the cross ribs between the studs give a larger wearing surface. It is suitable for all makes of machines.

Another popular Clincher tyre is the combination pattern, the tread of which consists of rubber and steel studs embedded flush with the ribs. It has been specially constructed with a heavy casing to stand the strain of the driving wheels of high-powered motor cycles. The unique tread design ensures an efficient non-skid under all road conditions, and the studs are so securely anchored that they will not pull out with ordinary usage. It is made to fit voiturette rims.

The North British Rubber Co., Ltd., Clincher House, Great Portland Street, London, W.

### Avon Tyres.

The Avon India Rubber Co. have strengthened their combination cover, which is of the three-ribbed variety, the steel studs being countersunk in the ribs, making it suitable for machines of any horse-power. They also purpose, if possible, to put down moulds for making their Sunstone covers on the 28×3in. size, suitable for American motor cycles. They also hope to be able to add a 650 mm.×65 mm. three-ribbed and also an oversize cover of the same type to fit the same rims, which are frequently met with on high-powered machines.

Messrs. the Avon India Rubber Co., Ltd., 19, Newman Street, Oxford St., W.

### Spencer-Moulton.

One of the most attractive tyres turned out by Messrs. Spencer-Moulton is the three-ribbed pattern, which we have used ourselves, and have found to be a most efficient non-skid. This tyre is recommended for general all-round utility; has excellent wearing qualities, and is very speedy. Owing to the ventilation of the tread afforded by the circumferential grooves and scientific method of construction adopted, the tyre keeps extremely cool and the minimum of friction is set up.

Messrs. George Spencer, Moulton, and Co., Ltd., 77, Cannon Street, E.C.

## Tyres and Clothing.—

## Palmer.

A most attractive cover has been lately placed on the market by Messrs. the Palmer Tyre, Ltd. It costs a great deal less than the Palmer Cord tyre of the same size, but is exceedingly durable, while the tread is of excellent rubber. The section which was shown to us had one of the ribs sliced for some little distance, and it was found to be quite impossible to pull off this piece of rubber. The tyre is made in the 28in. x 3in. size to fit 650 mm. x 65 mm. rims, or with a smaller bead for

26in. x 2½in. motor cycle rims; it can also be had in the 700 mm. x 80 mm. size to fit the rims referred to, as well as in the usual sizes. The tyre is built up of four plies of fabric, the strands of which run diagonally across the cover, alternately in opposite directions. This renders the cover exceptionally strong, and excellent results are being obtained from it. The inside is covered with a white paint, and in the event of a serious cut this paint may be scraped off and an internal patch applied. In these days when economy has to be studied, the introduction of the new Palmer four-ply fabric tyre will be much appreciated.

Messrs. the Palmer Tyre, Ltd., 118-123, Shaftesbury Avenue, E.C.

## Bates Tyres.

Among the several different pattern tyres sold by Messrs. W. and A. Bates, Ltd., probably one of the most serviceable is the No. 2 motor cycle tyre—the one illustrated. It is of the three-rib pattern, but the centre rib is broken at intervals, thereby giving a better grip on greasy roads and preventing wheel spin. The firm also make many useful accessories, one of which is the clip-on gaiter for fitting on the outside of a burst cover, while the tube gaiter which laces over the tube to prevent it blowing out of a damaged outer cover should also prove very serviceable. The Bates motor cycle tyres have been extensively used by the South African Defence Force in the German South-West Africa campaign. The firm also hold a two years' contract to supply tyres to the South African police throughout the whole of the Union.

Messrs. W. and A. Bates, Ltd., St. Mary's Mills, Leicester.

## "Stoppit" for Punctures.

Stoppit is a white glistening powder which, when mixed with water, forms a puncture-sealing solution. It is injected into the inner tube, where it will remain active as long as the tube is in use.

Stoppit, Ltd., 66, Moore Street, Birmingham.

## The Stelastic Tyre.

One of the most popular motor cycle tyres is the Stelastic ribbed "Chock-bead" cover. This is a practical non-skid unpuncturable tyre, which contains the qualities of the ribbed tyre and the non-cutting propensities of the Stelastic tread, which, as our readers will remember, consists of upstanding coils of steel wire embedded in rubber. The canvas

Stelastic ribbed tread.

Stelastic round tread.

used for the casing is of the best quality, so that side bursts are greatly minimised, while the walls are supported by the extra thickness of rubber extending from the tread to the beads. The illustration shows the particular form of bead fitted, and how securely it locks itself on to the rib.

Messrs. Stelastic Tyres, Ltd., 76, York Street, Westminster, S.W.

## Hutchinsons.

For 1916 Hutchinson tyres consist of the rubber-studded and the three-ribbed patterns in various sizes and types, the best known of which are the Brooklands, the Tourist Trophy, and the Passenger. The quality of Hutchinson tyres, which has so long been famous, is still maintained, and this quality was only obtainable after much money had been spent in the extensive laboratories at the Hutchinson factory in France. The rubber used in Hutchinson tyres is remarkable for its toughness and resiliency. A specially substantial three-ribbed tyre built up on four plies of the strongest canvas is suitable for use on heavy sidecar machines. It is made in the 650 mm. x 65 mm. size and 650 mm. x 65 mm. to fit 65 mm. rims, also 700 mm. x 80 mm. to fit the same rims. The well-known Hutchinson motor cycle boot, which has proved so invaluable in the trenches, is still listed.

Messrs. Hutchinson Tyres, Ltd., 70, Basinghall Street, E.C.

## The Kempshall Cover.

There is no change in Kempshall tyres for the coming season. The chief speciality is a 650 mm. x 65 mm. tyre of the well-known Kempshall non-skid pattern, designed to fit 700 mm. x 85 mm. rims. It is especially suitable for sidecar work, and on a sidecar combination it is said that 15,000 to 18,000 miles can be obtained on these covers. It is specially strengthened, and has five plies of canvas.

Messrs. the Kempshall Tyre Co., Ltd., 98-100, Long Acre, W.C.

## Hermetic Peerless Tyres.

The Self-sealing Rubber Co. are now making their special heavy Hermetic Peerless motor cycle tyres in 28x3 size to meet the increasing demand for this size of tyre on both the home and Colonial markets. The pattern is the same as on the smaller sizes, viz., three ribs, the centre one being formed in a zigzag pattern to give a good grip in both directions.

The Self-sealing Rubber Co., Ltd., Hermetic Works, Birmingham.

## Stepney.

The Stepney Spare Wheel Co., who have long made tyres for cars, have now turned their attention to a cover suitable for motor cycles. It is a combination of the ribbed and studded patterns. The tread is formed by two rubber ribs running round the side, while the centre is formed by a row of rubber studs. The advantages are that the tyre combines the features of both types, the ribs preventing side-slip, while the studs give a good grip for the forward drive and braking action.

The Stepney Spare Motor Wheel, Ltd., Stepney Works, Llanely.

## Excelsior Retread.

Messrs. the Excelsior Rubber Co. specialise in retreads, and are experts in all other types of tyre repairs. They claim to be the oldest established firm in the United Kingdom specialising in tyre repairs.

The Excelsior Tyre and Rubber Co., Hurst Street, Birmingham.

## Wood-Milne.

The extra strong "special" cover has four layers of canvas as support, and, on account of its strength and thickness of tread, can be recommended for heavy work. The road wearing surface is formed into squares, the ridges thus formed greatly assisting in the stability of a motor bicycle in grease.

A useful Wood-Milne accessory is the adjustable belt punch, which ensures the hole being drilled centrally. A sample is presented free to buyers of W.-M. tyres. Messrs. Wood-Milne, Ltd., Preston.

## Skew.

Skew covers are noted for their long wearing qualities. A liberal amount of first-class quality rubber on the tread ensures this longevity.

The Skew cover is sold in all sizes for motor cycles and runabouts, and the formation of the tread, which is composed of staggered indentations, possesses great anti-skidding qualities.

Messrs. Oylers, Ltd., 35, New Cavendish Street, Great Portland Street, W.

**Tyres and Clothing.—****A Chamois Leather Waistcoat.**

At Messrs. Taylor's we saw some very excellent chamois leather waistcoats, which motor cyclists will find especially comforting at this time of the year on cold days. The chamois leather is extremely pliable and comfortable to wear, and is also very warm. The waist-

coat in question is supplied with pockets, has a strap behind, long sleeves, and button cuffs, and is designed to button close up to the neck.

Waders with leather soles, which will keep the rider's extremities dry in any weather, are another speciality of this firm. We were also much pleased with a fleece-lined raincoat, which can be used either for motor cycling or walking.

Messrs. H. Taylor and Co., Ltd., 21a, Store Street, Tottenham Court Road, W.C.

**Clothing at Brown Brothers.**

Not many people are aware that Messrs. Brown Bros., Ltd., have a clothing department. Recently we made an inspection of this, and were most favourably impressed. One of the most practical motor cycling suits is made of the best quality water-proof material. The trousers are of the half-seat type, and adequately protect the front of the body. The coat is double-breasted and provided with a useful storm flap which prevents the rain from penetrating. It is interesting to note that a number of these have been supplied to the Belgian Government. We also saw some leather waistcoats and some remarkably fine tan cap

driving gloves lined with llama wool, which are both soft and very strong. They are sold at a very moderate price and appear to be excellent value for the money.

Messrs. Brown Bros., Ltd., 15, Newman Street, W.

**A Motor Cyclist's Coat.**

It is a curious fact that the war has not only brought the importance of the motor cycle before the general public, but motor cycling clothing has been used to a very large degree by military units which have nothing whatever to do with motor cycles. The motor cycle wader has been proved to be invaluable in the trenches, and the same may be said of the leather waistcoat. Oilskins, too, are in great demand. Now, the coat which we illustrate herewith was primarily intended

for the military, but with the very smallest amount of alteration it can be made suitable for the motor cyclist. It is one of Messrs. Dunhill's best productions, and is well cut in proofed twill and lined with camel fleece. Between the camel fleece and the twill is a lining of oil silk, which thus prevents any wet from reaching the wearer. It is provided with a belt and a strap round the waist, so that it excludes the wind. It has a particularly well designed collar, which is secured by a strap, and so arranged that it may button well out of the way when out of use. A very good point about it is that a spot of oil (though, of course, it will stain the coat) will not in any way interfere with its impermeability.

Messrs. Alfred Dunhill, Ltd., 359-361, Euston Road, N.W.

**A Motor Cycling Cap.**

Messrs. John Piggott's outfitting department is very completely stocked

with all that the motor cyclist needs to keep him warm and to exclude rain.

Motor cycle suits are to be found in all qualities, and to suit all pockets.

While looking round the clothing department we saw a very useful cap, an illustration of which is reproduced herewith. It will be noted that it is provided with a flap at the back which folds down, and thus prevents rain from getting down the rider's neck.

We also inspected several leather waistcoats, numbers of which have been supplied to officers for use in the trenches. They possess the advantage of being well ventilated.

Messrs. John Piggott, Ltd., 117, Cheapside, E.C.

**Smart and Useful Overalls.**

The overall suits made by Messrs. Mosely and Smith undoubtedly combine smartness with utility. The suit illustrated is made of thoroughly proofed material lined with tweed. It has four pockets, while the special watertight fastening in front renders it very suitable for cold and wet weather. The complete trouser overalls are made with an elastic band at the top, which renders them very convenient, obviating the fastening or unfastening of buttons or buckles. The legging portions are fastened by patent fasteners.

Messrs. Mosely and Smith, Butter-shaw, Bradford.

**A Motor Cycle Coat.**

A particularly practical motor cycle coat is sold by Messrs. Charles Cuthbe and Co. It is an improved form of the old-fashioned poncho, which is particularly effective in excluding the wet. There is no opening whatsoever except for the head, and therefore it is impossible for wet to get in. The neck opening is a type of gusset, and therefore should serve its purpose exceedingly well. The coat is provided with a belt.

Messrs. Charles Cuthbe and Co. are also known to our readers as the vendors of the Max motor cycle tyre and the Max belt, which latter is fitted with a special carefully centred core, and can be had in lengths of 60ft. It is composed of Ceylon rubber specially toughened.

Messrs. Charles Cuthbe and Co., 37, Great Eastern Street, E.C.

**Tyres and Clothing.—****Sidcar Shock Absorbers and a Cleaning Outfit.**

A useful sidcar fitment is sold by the Service Co. to interpose between the spring eye and the cross bar supporting the body. It has a shackle action, and the springing is in compression. This should greatly add to the passenger's comfort, as it tends to absorb all the smaller road vibrations, and should be much appreciated at the present time on account of the bad state of the roads in many parts.

Messrs. The Service Co., Ltd., 292, High Holborn, W.C.

**Clothing at Burberrys.**

For many years the firm of Burberrys have made a special study of the requirements of the motor cyclist as regards clothing, and riders are now able to purchase the very latest designs in motor cycle suits built up of the renowned Burberry material. One of the most ingenious motor cycle suits we have seen is the

Burberry Tielockan coat. It is a buttonless, double-breasted garment, mainly secured by a single strap. Inside the coat is a small strap which fastens a portion of the coat by means of glove button fastenings, the rest is pulled over into position, and the strap, which possesses two patent buckles, is then secured with the greatest celerity. This suit is made of the best Burberry Gabardine, and can be had lined with wool, fleece, or leather. It is fitted with excellent pockets, which enable one to have access either to the pockets of the Tielockan coat or to those in the inner coat. The back of the coat is slit behind, while the strap is also arranged so that it is adjustable at the back of the garment.

We also saw an attractive looking motor cycle coat, fitted with what is known as the Puttee collar, which means that the neck is secured by means of a long strap, which goes twice round, and then fastens up with glove button fasteners.

Quite a novelty in the way of gloves is the new Burberry Gabardine glove. The palms and fingers are covered with the best leather, while the back is of Burberry material lined with wool.

Messrs. Burberrys, Haymarket, S.W.

**Grose's Transport Gloves.**

Grose's transport gloves are very practical articles, and are eminently suitable for use by motor cyclists. The back is made of waterproof material, while the

palm, thumb, and first finger are composed of the best leather. The rest of the glove is of soft leather, while the interior is of natural lamb's wool. The gloves are extremely warm.

As regards clothing, Messrs. Grose make a speciality of the Brooklands motor cycle suit, which is made of waterproof material. It is absolutely proof against the elements, and is of a most durable quality. Either seatless trousers or leggings may be had with this suit.

Messrs. James Grose, Ltd., 4, Old Jewry, E.C.

**The Aquacall Motor Cycle Suit.**

Messrs. A. W. Gamage have lately placed on the market a very excellent motor cycle suit known as the Aquacall. It follows very much the lines of the ordinary motor cycle overall suit, but is made of waterproof cloth instead of ordinary macintosh, and for winter use it is fleece-lined. Numbers of these are being sold to military motor cyclists. It is fitted with a belt and wind cuffs.

The leggings are slipped on, and there is no fastening at the side at all, as they are kept in position by means of an elastic strap under the boot.

Messrs. A. W. Gamage, Ltd., Holborn, E.C.

**A Serviceable Motor Cyclist's Suit.**

Messrs. Selfridge's clothing department has taken up the question of motor cyclists' clothing in a very practical manner. They have lately introduced a

riding suit, the material of which has the appearance of ordinary cloth. Actually, however, it is perfectly waterproof, and is of double texture throughout. The particular sample shown to us was of a drab colour, and of just such an appearance as one would find in a light overcoat. The effect is really quite attractive. The sleeves are provided with wind cuffs inside and a wind strap outside, and there is also a belt round the jacket. The trousers are of the semi-seatless type, and are so designed that they protect the rider's body in front. The legs are gusseted, and are supplied with glove button fastenings.

Our illustration shows the Selfridge double-texture waterproof suit, which is

somewhat similar to the one we have just described in design, except that the leg overalls are provided with straps round the ankles.

Messrs. Selfridge and Co., Ltd., Oxford Street, W.

**A.K. Specialities.**

The A.K. clothing specialities are too well known to need illustration. Leather waistcoats, throat protectors, and leather racing helmets with ear rolls (often used by tourists) are the leading lines. We can speak of the quality of A.K. accessories from personal experience.

A.K. Manufacturing Co., Birmingham.

**The Chemico Blow-out Patch.**

An exceedingly useful accessory is the Chemico Blow-out patch, which owes its *lucus a non lucendo* title to the fact that it does not blow out itself, but prevents the tube from doing so. The patch consists of a specially prepared canvas, through which numerous spikes protrude. These spikes embed themselves

into the cover round the burst, and, therefore, securely anchor the patch by the pressure of the inner tube underneath. The American patents for this patch have been purchased by the County Chemical Co., Ltd.

County Chemical Co., Ltd., Chemico Works, Birmingham.

# IGNITION APPLIANCES AND LAMPS.

A perusal of this section leaves one with the distinct impression that electric lighting is rapidly gaining in popularity for motor cycles as well as cars. Probably lighting dynamos will become general ere long. It is gratifying to record an improvement in the quality and numbers of British magnetos, whilst it is generally admitted that British-made sparking plugs are second to none.

## The Simms Sparking Plug.

The Simms is a well-made plug provided with substantial electrodes. From its design, we should say that it should be most unlikely to soot up. The insulating material is of porcelain.

Messrs. Simms Motor Units, Ltd., 191, Wardour Street, W.

## M.L. Magneto.

The M.L. magneto, which is entirely made in Coventry, is certainly a most workmanlike job. The general outlines closely resemble those of the Bosch.

These machines are at present made in three types, each type being made in both standard and lightweight models. The types are for singles, horizontal twins, and V twins between 50° to 60°. These magnetos are very thoroughly tested,

which test includes a six-hour endurance run at high speed, and a limit test for sparking at low speed and for the energy contained in the spark. The demand for these magnetos has been so great that the firm have been obliged to take over much more extensive premises, into which they will move shortly.

The M.L. Magneto Syndicate, Ltd., Carlton Works, Coventry.

## The J.P. Head Lamp.

A head lamp which is excellent value for the money asked for it, and is sold complete with generator, is the J.P. It will be noticed that the bracket fixing is such that it complies with the Defence of the Realm regulations.

A very neat tail lamp in oxidised finish was also shown to us on the occasion

of our visit. Both it and the head lamp are British made.

Messrs. John Piggott, Ltd., 117, Cheapside, E.C.

## The Dumolite Rear Lamp.

Seeing that rear lamps are practically everywhere compulsory in this country, we direct attention to the Dumolite motor cycle rear light, which was early on the market as one of the most practical leaders of this type. The lamp is cast out of solid aluminium, together with the bracket, and well finished. It is provided with a tap at the base, and has also a white

glass at the side, so that it may be used for illuminating the rear number.

Messrs. A. J. Dew and Co., 21-23, Endell Street, Long Acre, W.C.

## Sphinx Plugs.

The Sphinx Co., which has been for some time unable to give prompt deliveries to the general public of its well-known spark plugs owing to the demands of the Government, is now able to supply more quickly, and is fast making good its overdue orders. The firm has now established its own pottery for the manufacture of steatite insulators, and so claims to be the only manufacturer of purely British steatite plugs. The touring model plug is of the two-gap type, the central electrode is of a most substantial construction, and the other two electrode points are made of iridium. The steatite insulator is secured in the

oxidised steel body by means of gastight cement, while in the other two models, C28 and A3, this is secured by means of a locking nut.

Messrs. the Sphinx Manufacturing Co., 242, Bradford Street, Birmingham.

## C.A.V. Magnetos and Lamps.

While at Messrs. C. A. Vandervell's we recently saw the latest pattern sidecar combination electric lighting outfit. In this case the source of current is a large 33 ampere-hour 8-volt accumulator, for the storage of which there is plenty of room in the sidecar. Sold with this set is a very neat switch-box, designed to be clipped on to the top tube. The outfit comprises a powerful head lamp for the motor bicycle, two types of tail lights, and two types of sidecar side lamps, as well as a small inspection lamp, together with the necessary cable.

Messrs. Vandervell have also for a long time devoted their attention to the manufacture of C.A.V. Ruthardt magnetos, and we illustrate herewith eight magnetos, suitable for various patterns of motor bicycles, such as Norton, B.S.A., Rudge, Douglas, and Triumph. The variation generally occurs in the shape of the baseplate, the height

The range of C.A.V. British-made magnetos

New C.A.V. sidecar lighting set.

of the spindle, and type of spindle. Some of these magnetos are also provided with means of fixing a Bowden control, while other variations occur in the design of the advance spark lever.

Messrs. C. A. Vandervell and Co., Ltd., Warple Way, Acton Vale, W.

#### A Combined Rear Lamp and Number Plate.

Quite a good rear lamp for motor cycles and sidecar combinations has been placed on the market by A. W. Bond. The case contains a dry battery, as will be seen in the illustration, and

Bond's self-contained rear lamp.

the lid thereof contains an electric bulb, switch, and red light, which shows to the rear and illuminates the number which is painted upon the exterior of the box. The case is fitted transversely at the rear of the luggage carrier. The whole device is waterproof, contains a

Bond's self-contained rear lamp showing bulb, battery, and windows of red and white glass.

large battery, which lasts for sixty to seventy hours, and costs but 2s. to replace. The bulb is mounted on a spring, so that it cannot be damaged by vibration. There are no external wires, and consequently the lamp should be a most reliable one.

A. W. Bond, 245-247, Euston Road, N.W.

#### The Apollo Plug.

A well-made and substantial plug is the Apollo high compression plug. This plug is specially designed to withstand the high compression encountered in aero and some motor cycle engines. The insulator of this plug is made of mica

by a special process, and the plugs are tested to a pressure of 500 lb. per square inch. The electrodes are of the two-gap variety and are very substantial.

Apollo Mfg. Co., Moseley Street, Birmingham.

#### Some Ward and Goldstone Lamps.

Messrs. Ward and Goldstone have lately devoted considerable attention to electric lighting on motor cycles. The

accumulator used with the sidecar combination set is 7in. high by 4½in. x 5½in., and when charged will provide a current

giving from fifteen to twenty hours continuous work. A separate switch is fitted to each lamp.

This firm has also placed on the market a special motor cycle lighting set known as the Penetra, consisting of a motor cycle head light complete with metal filament bulb, twin armoured conducting cord, switch, and four-volt Volex Giant battery, which gives up to sixty to eighty hours lighting. This can also be supplied with a tail lamp.

Messrs. Ward and Goldstone, Sarapson Works, Salford, Manchester.

#### The Forward Spark Plug.

The new type M Forward plug is of the two-gap variety, the three electrodes being very substantial. The points where this plug differs from the previous patterns are that the outer insulator is fixed into the metal body by means of a patent enamel which ensures the plug being absolutely gas-tight. To prevent any likelihood of trouble due to an accidentally cracked insulator, an inner one made of mica is fitted which effectually prevents short circuits from this cause.

The Forward Motor Co., Summer Row, Birmingham.

#### Bluemel Accessories.

Most of the accessories sold by Messrs. Bluemel for the use of motorists are so well known that even a passing mention is almost unnecessary. An accessory which is familiar to practically every motor cyclist is the handy tyre inflator with folding stirrups; the usefulness and

excellent workmanship of this have made it universally popular. Another fitting sold by this firm, and which we illustrate, is the Shortproof plug terminal; this consists of a cap made of a kind of vulcanite, which fits over the plug terminal to protect it from rain or damp. The terminal is easily detached by merely pulling off. The spigot on to which it is pressed is screwed on to the plug terminal and is detachable; being screwed to a standard thread, it is suitable for practically any make of plug. Our illustration shows it as fitted to a Bluemel Steatite insulator plug. The sidecar windscreen made by this firm is also a useful fitment. It is made with a light tubular frame, the transparent portion being of celluloid. It is adjustable, and can be moved instantly to allow of entering the car.

Bluemel Bros., Ltd., Wolston, near Coventry.

## Ignition Appliances and Lamps.—

### Ignition Appliances and Plugs.

An exceedingly useful electric torch has been placed on the market by Messrs. Robertsons Motors. It contains a very large battery, and gives a splendid light.

Robertson's electric torch.

It stands 8in. high, and is 2½in. in diameter. It will burn for 100 hours, and can be conveniently carried in a sidecar and used for effecting repairs by night.

Messrs. Robertsons Motors, Ltd., 157b, Great Portland Street, W.

### Electric Head Lamps.

Few accessory dealers understand more clearly the wants of motor cyclists than Mr. A. H. Hunt. The larger lamp, which is plated, is an exceedingly practical head light. It is beautifully finished, and has a scientifically designed

reflector calculated to give the best possible results. It conforms exactly to the new regulations under the Defence of the Realm Act, even to the manner of the adjustment of the lamp to the bracket. Though the lamp cannot be swung in such a manner as would enable it to be used for signalling, the beam can be set so as to suit the requirements of the rider, as a small degree of movement is allowed. The bulb holder is also worthy of note, as it provides a particularly firm fixing for the wire and, at the same time, permits the bulb to be accurately focussed. The bracket is substantial and easily attached to the handle-bars. The other lamp is of somewhat smaller dimensions, moderate in price, of pleasing appearance, and very efficient. The bracket is also different from that of the lamp we have just described, since it is designed to fit upon the ordinary lamp bracket. A very similar focussing arrangement to that employed on the lamp first described has been adopted, but the wires fasten on externally, and in the centre of the back of the holder there is a switch.

Mr. A. H. Hunt, 115, Cannon St., E.C.

Lucas dry battery lighting set, sold by Messrs. Ward and Goldstone.

### The Lucas Lighting Dynamo.

Now that electric lighting is becoming every day more popular, the Lucas dynamo is a fitting which will undoubtedly appeal to the motor cyclist with the luxurious sidecar outfit. This machine is made in two sizes, E10 and E20, both giving the same output, viz., 6 volts 5-6 amps.; the only difference being that the smaller one has to be run at a slightly greater speed. The machines are cylindrical in shape, and are made absolutely water-tight, yet all parts, such as the commutator, likely to require attention are easily accessible, being enclosed under a detachable conical-shaped cover held in place by a single large screw. The current when charging is kept practically constant by a patent electric regulator which is perfectly simple and reliable. When the dynamo is not charging there is no magnetic drag whatever, and when charging the

minimum of power is required to drive it, and it does not perceptibly influence the pulling of the engine. The famous King of the Road acetylene lamp sets for motor cycles remain unaltered.

Messrs. Joseph Lucas, Ltd., Birmingham.

### F.R.S. Lamps.

The famous F.R.S. lamps, both acetylene and electric, are sold in numerous different shapes and sizes suitable for practically any type of cycle. The outline of these lamps is quite distinguishing, all corners being nicely rounded off, thus giving a neat appearance while at the same time rendering them easy to clean. A neat fitting on some models is a special lug for carrying the A.A. badge. The chief feature is, of course, the F.R.S. special Mangin lens fitted to all models, the perfect design of which makes it possible to use practically every available ray of light. A very neat accessory is the F.R.S. electric adapter. This is a device intended to fit over the

existing burner, by means of which it is possible instantly to convert the lamp from gas to electric. It consists of a small holder into which screws a small electric bulb and parabolic reflector. The current is supplied from a small dry accumulator carried in a leather case. Although the beam of light is penetrating, there is very little glare. An excellent dynamo outfit suitable for any machine is also made and sold at a very reasonable figure.

Messrs. F.R.S. Lamps, 7 and 9, Pershore Street, Birmingham.

### Standard Plug.

A very serviceable moderate-priced all-British plug is the Standard. The electrodes, which are made of pure nickel, form two gaps, and are very substantial. The porcelain insulator is secured in position by a brass locking nut; it is, therefore, quickly and easily detachable if at any time it becomes necessary to renew either this or any other part, all of which can be obtained at a low cost.

The Standard Accessories Co., Ltd., 66, Moor Street, Birmingham.

### Lodge Plug.

The latest design of Lodge plug is the racing model. The metal body of this new plug is grooved in order to expose a considerable surface to the air for extra cooling; the brass top is also grooved in a similar manner. The insulation is composed of mica. The points are the same as those in the special two-stroke model, viz., single gap, the side electrode being formed by a nickel plate let into the body, having a hole in the centre through which the centre electrode, also of nickel, projects, and a small protuberance on the side.

Lodge Sparking Plug Co., Ltd., Wrentham Street, Birmingham.

### Miller Lamps.

Among the large range of lamps manufactured by Messrs. Miller and Co., the No. 31H is undoubtedly a most serviceable fitting. A 4in. genuine

Mangin mirror is fitted, and the lamp is of graceful appearance. The generator and lamp are carried on the one bracket, so that the weight of the lamp balances the weight of the generator. This is carried on a girder type bracket clipped by two clips on the top of the handle-bar.

Messrs. Miller and Co., Miller Street, Birmingham.

# DUNHILLS PATENT TRIPLE WINDSCREEN.

In Polished Walnut with Nickel Fittings :

Price complete with side wings	- - -	£3 0 0
Price of Single Screen	- - -	£2 2 0

**A**N ideal windscreen—keeps the passenger always snug and cosy in the coldest weather and free from draughts.

The side wings are detachable, and the screen can be tilted to any angle. It will fit any make of car.

A twist of a wing nut is sufficient to release the catch and let the screen swing across and allow the passenger to alight.

# BINKS CARBURETTORS ON 2-STROKES

These grand little machines are wonderfully improved by fitting a Binks, it makes them **run slower without 4-stroking**, start easier, and makes them tick over when in free, and greatly increases the mileage per gallon.

Winner of the much coveted Manufacturers' Trophy (by Mr. Robbins), and used by Mr. O'Donovan on his wonderful record-breaking feats.

## WHY NOT AT ONCE IMPROVE YOUR MACHINE?

I send on approval for 4 weeks' trial and return your money, less examination fee, if you are not delighted with it.

### TESTIMONIALS EVERY DAY.

"I have fitted the Carburetter, and I find it does on my Allon 2-stroke, 40 more miles to the gallon than the carburetter sent out with the machine."

"I can now run at just half the speed without any 4-stroking. I am thoroughly satisfied."

"I have now got the jets right, and on my Calthorpe can do 115 miles to the gallon, and the power is marvellous."

"My machine is quite another thing since I fitted the Binks. Very little 4-stroking, 120 miles to the gallon, and terrific power."

And so on, and I can show you the originals at my works.

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd.**, and crossed **& Co.**

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20 Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pay carriage one way. For all transactions exceeding 10 in value, a deposit fee of 2s. 6d. is charged, when under 10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

**1913 3 1/2 h.p. Humber**, 3-speed, and Canoelet sidecar; £40, or exchange for higher powered outfit.—J. Bartlett, Woodhouse, And ver. [X9665]

**HUMBER**, 3 1/2 h.p., late 1911, 2 speeds, 1914 Water-cooled sidecar, excellent condition, used week-ends only: £26.—Mascott, Llandrindod Wells. [X0195]

**3 1/2 h.p. 1914 Humber**, 3-speed, torpedo sidecar, all accessories: £50; cash or easy terms.—R. E. Jones (Garages), Ltd., Swansea, London, Cardiff. [0724]

**2 1/2 h.p. Twin Humber**, 1913 1/2, 3-speed and clutch, grand condition, very fast: £27, or nearest offer, or consider exchange for 3 1/2 h.p.—G. Williams, 6, Gwendolene Av., Upton Park, E. [9001]

**1914 3 1/2 h.p. Humber**, 3-speed, new tyres, tubes, and built speedometer, lamps, horn, engine and gears just overhauled, whole condition equal to new: £40, also £16/14 1914 Bramble sidecar, £10.—Fairlie, Tisbury, Wilts. [8926]

**HUMBER**, 1912, 3 1/2 h.p., new 2-speed, low wicker sidecar, excellent tyres, electric horn, speedometer, Lucas lamps, neat appearance; owner's guarantee: £20.—W. Stern, Motor Laboratory, Royal College of Science, South Kensington. [X0107]

## CORONET Sidecar Chassis

is designed for long life, and has a wonderful reserve of stability, and is safe on greasy roads. Luggage carrier built into frame. Cannot shake loose, and is a boon when touring.

£10 15s.

Send for illustrated catalogue describing these well known Sidecars.

EXCHANGES.

TRADE SUPPLIED.

We can give immediate delivery of all models, and suitable for any make of machine.

## Coronet Sidecars for Harley-Davidsons.

We make a special Sidecar, enamelled French grey to match, 28 x 3 in tyre, apron to cover entire body, and 4-point attachment. £13 10 Immediate Delivery.

## 7-9 h.p. HARLEY-DAVIDSON.

11J, electrically equipped, 3 speeds ..... £76 13  
11F, standard 3-speed model ..... £68 5  
Delivery from stock. Exchanges entertained.

## NEW 1916 FORDS.

5-seater Touring Car ..... £135  
Delivery Van ..... £130  
Motor cycles taken in exchange.

## SPECIAL BARGAINS.

3 1/2 h.p. **LEA-FRANCIS**, 1915, nearly new, 3-speed, kick starter, Hercules £13 13 Sidecar, £5 5 speedometer, £3 10 lamp set; the whole cost £94 10 ..... £65 0  
2 1/2 h.p. **WOLF**, 1916, 2-stroke, 2-speed ..... £33 10  
4 h.p. **WOLF**, 1916, 3-speed, chain drive ..... £55 11  
2 1/2 h.p. **LEVIS**, 1915, 2-stroke, 2-speed ..... £28 15  
3 1/2 h.p. **HUMBER**, 1914, 3-speed model, with Sidecar ..... £39 15  
3 1/2 h.p. **PRECISION**, 1912, nice condition ..... £18 15  
1913 **HUMBERETTE** Cycle Car, hood, screen, electric lamps, 3 speeds and reverse, good tyres ..... £55 0  
3 1/2 h.p. **RUDGE**, 1912, free-engine model ..... £19 15  
4 h.p. **QUADRANT**, 1912, 3-speed model ..... £20 15  
3 1/2 h.p. **SINGER**, 1912, 3-speed model, with cane Sidecar ..... £25 0  
3 1/2 h.p. **SINGER**, 1912, 3-speed gear ..... £22 10  
3 h.p. **HUMBER** tricar ..... £5 5  
3 1/2 h.p. **REX**, 1909, 2-speed gear ..... £13 10  
1 1/2 h.p. **WOLF**, 1912, magneto ..... £9 10  
4 1/2 h.p. **JAMES**, late 1913, 3-speed, chain drive, kick starter, coach Sidecar ..... £43 15  
Light Delivery Car, 8 h.p. De Dion engine, 3 speeds, less tyres ..... £9 15  
3 h.p. **CLYDE**, M.O.V. ..... £5 5  
3 1/2 h.p. **PREMIER**, 1911, B.S.A. 2-speed ..... £19 15  
1915 **TRUMBULL** Light Car, hood, screen, detachable wheels, speedometer, electric horn and lamps ..... £89 15  
6 1/2 h.p. **DE DION** 2-seater Car, in splendid condition, 2 speeds and reverse, bucket seats, tyres worth £8, 3 good lamps ..... £16 15

## MISCELLANEOUS.

8 h.p. De Dion Water-cooled Engine ..... £7 0  
1914 Mabon Free Engine, adjustable pulley Druid Spring Forks for 3 h.p. machine ..... 25/-  
New Electric Cycle Car Side Lamps ..... 10/6  
Stewart Mechanical Horns ..... 25/-  
Amac Carburetter, h.-b. control, for twin Rex ..... 6/6  
Triumph Carburetter, H.B. control ..... 7/6  
Amac Carburetter, off Enfield ..... 8/6  
New Underslung Sidecar Chassis, complete Wicker Sidecar Bodies; to clear ..... £4 0  
New Coach-built Body, side door ..... 3/6  
Brand New Waterproof Magneto ..... 57/6  
New 2 1/2-Clare Brass Electric Tail Lamp ..... £3 15  
New 2 1/2-Stationary Petrol Engine, two flywheels, magneto; dist'd £22 10 ..... 4/11  
New Torpedo Cane Sidecar Body ..... £3 0

## MOTOR CYCLES FOR SALE.

## Indian.

**FOR Sale**, 7-9 h.p. Indian, very fast; exchange for Douglas, or sell.—Howley, Leizes. [8898]

**INDIAN**, 1914, 7 h.p., recently overhauled; £45.—Munro, 14, Falcon Sq., Inverness. [X0096]

**INDIANS**, 1916; immediate delivery, all models, these fine machines.—W. P. Edwards, Taunton. [X9966]

**1915 Indian**, 5 h.p., 3-speed, clutch, T.T. bars, kick starter; £50.—Blake, 218, Westbourne Grove. [9099]

**1915 3 1/2 h.p. Indian**, 3-speed, kick starter, T.T. bars, tyres perfect, not ridden 500 miles; cost £65, accept 48 gns.—B. Carroll, Thorndene, Lytham. [8962]

**INDIAN**, 1915 (July), 5 h.p., 3-speed, unpunctured, dynamo, C.A.V. head light, tail light, horn, fast; bargain, £45.—Lt. Williams, R.E., Brightlingsea. [X0016]

**1915 Indian 7 h.p. Road Racer**, model D, free engine, clutch, hand-operated, speedometer, lamp, generator, horn, complete; £38.—Crisswell's Garage, Newmarket. [X0183]

**INDIAN**, 1916 model B, 5 h.p., not a month old, 3 speeds, kick starter, lamps, horn, perfect condition; £60; officer ordered abroad; quite genuine.—Wigg, 31, Bow St., London, W.C. [9136]

**5 h.p. Indian**, 1915, mechanically perfect, very fast, Dunlop tyres little wear, 3-speeds, clutch, P. and H. lamps, speedometer; £55.—King and Harper's Garage, Bridge St., Cambridge. [X0126]

**INDIAN**, red, 7-9 h.p., 1913, Millford coachbuilt sidecar, speedometer, lamps, tools, recently overhauled, excellent running order; owner in France; price £50.—Cooper, 86, Woodstock Rd., Oxford. [X0102]

**1915 5 h.p. Indian**, 3-speed, engine thoroughly overhauled, Kempshall tyres, front tyre good; 40 gns.—Julian, Broad St., Reading. Biggest motor cycle and light car dealer in the South. Phone: 1024. [X0263]

**1915 1/2 Indian**, 5-6 h.p., 3-speed, Millford sidecar, lamps, horn, tools, not done 700 miles, perfect condition; £65; will ride 50 miles.—Lieut. Stileman, 9th Berks, Bovington Camp, Wool, near Bournemouth. [9030]

**1915 Model C 7 h.p. Indian**, 3-speed, new, slightly shop-soiled; list price £78, going now at £68/10, complete electric equipment and speedometer; don't miss this chance.—Alexander's, 115, Lothian Rd., Edinburgh. [8256]

**1916 7 h.p. Indian**, spring frame, 3-speed, electric lighting, speedometer, etc., absolutely in stock, £78; 1916 5 h.p. 3-speed model in stock, the solo or sidecar machine, £70.—Julian, Broad St., Reading. Phone: 1024. [X3145]

**INDIANS**.—All models from £49/10 to £90; early delivery. No connection with any adjoining concern whatsoever. Office hours 8 a.m. to 6 p.m. Closed dinner hours.—Messrs. Green Taxis, Villiers St. Garage, Claring Cross, London. [8600]

**INDIAN**, 1914, 7-9 h.p., Millford coachbuilt sidecar, fitted with hood, screen, luggage grid, pair electric head lamps, tail lamp, Binks and Indian carburetter, all accessories, condition like new; any severe trial given: 64 gns.—265, High St., Sheerness. [8908]

**INDIAN**, model B, £70, Power Plus G £75, Power Plus F £90, electric model, all in stock; also 1915 model B, semi-T.T. 3-speed, only 2 months old, 55 gns.; exchanges, liberal deferred payments.—Lamb's, 151, High St., Walthamstow, and 50, High Rd., Wood Green. [9011]

## Ivy

**IVY** 1914 2-stroke, little used and as new, lamp, horn; £24/10.—Layton's Garage, Bicester, Oxon. [X0230]

**1913 3 1/2 h.p. Ivy** Precision Motor Cycle and sidecar, 3 speeds, Bosch mag., B.B. carburetter, lamps, tools, bags: £30.—12, Blackhorse Lane, Walthamstow. [X0099]

## Ixon.

**IXION**, special show finish, in stock; immediate.—W. and H. Motor Co., Ltd., 287, Deansgate, Manchester. [8660]

## James.

**1913 4 1/2 h.p. James** and Canoelet sidecar, complete, lamps, etc.; £41.—Cross, Jeweller, Rotherham. [X0150]

**JAMES**, 4 h.p., 1914, bought June, 1915, fixed gear; bargain, £25.—Collins, 192, Windmill Lane, Smithwick. [X0187]

**JAMES** Late 1915 Combination, complete with lamps, horn, apron, not run 1,000 miles; £60.—Stevens, Gooch St., Birmingham. [X0238]

**JAMES**, May, 1915, 3 1/2 h.p., 3-speed countershaft, chain drive, as new; what offers?—A. Darrington, Penrhyn, Holt Whites Hill, Enfield. [8883]

**JAMES**, 1915, 2 1/2 h.p., 2-stroke, 2-speed lightweight, in splendid order; £29/10.—Eice and Co., 15-16, Bishopsgate Av., Camomile St. E.O. [0492]

**JAMES** 1916 Combinations, actually in stock, £80/15; one with Lucas lighting set, £97/7.—T. Stevens (James Expert), Gooch St., Birmingham. [X0237]

**1914 1/2 James**, 4 1/2 h.p., 3-speed countershaft, kick start, James Canoelet sidecar, Lucas lamp, new condition; trial: £45, complete.—Hallam, Rosedale, Dove Holes, Stockport. [X0101]

**Six Thousand Recruits.**

**N**OW that compulsory service is at hand, we may pause to record in figures the services that it has been the privilege of this journal to render in the matter of voluntary recruiting. At the outbreak of war, when this country—not entirely to its discredit as a peaceable nation—was caught entirely unprepared for war on land, it was clear that strenuous efforts would be required on the part of Great Britain to uphold the cause of the Allies. It was patent, too, that motor cyclists as a body, being mostly of a young and energetic class possessed of overflowing patriotism and enthusiasm, were destined to take a great part in the world conflict. That being so, we lost no time in utilising *The Motor Cycle*, with its huge following scattered all over the world, as a recruiting medium, particularly, of course, for the motor cyclist sections. It is a tribute to British patriotism that never an appeal has passed unanswered, whether it has been R.E., M.M.G.S., R.F.C., or A.S.C., M.T. When in years to come one halts to reflect upon the organisation of our Army, nothing will be more stirring than the vision of splendid young fellows rolling up in hundreds to answer the call. Now as the end of the voluntary term of enlistment is approached, we look back with no little satisfaction upon having passed the 6,000 mark, this number representing recruits whose applications for enlistment we have handled personally. It is hardly necessary for us to interpose that this number by no means represents the total number of motor cyclists serving in H.M. Forces, as thousands are rendering yeoman service in the infantry ranks and various other sections of our big Army. Neither do we attempt to estimate the number of men who, in response to announcements in the editorial columns, have proceeded to the centres named and enlisted direct.

Originally, by reason of the immense influx of recruits, it was impossible for recruiting officers

to give motor cyclists the specialised attention necessary; consequently, after a time, we received direct appeals from Army officers to assist, and the Editor was subsequently appointed an Inspecting Officer for Royal Engineer Despatch Riders, and authorised by the C.O. of the Motor Machine Gun Service to examine motor cyclist and car driver recruits in their technical ability, and to accept those proficient. The men came from all over the British Isles and were frequently referred to us by their local recruiting officers. Work of this kind must necessarily be outside the scope of the ordinary recruiting officer, whose main duty is to fill the line regiments.

It is hardly necessary to say that our work has been entirely honorary, since we have regarded it as a duty and a pleasure to assist the hundreds of readers who applied. On many days quite a formidable number of applications were received, which involved the help of several assistants. We value highly a letter received last June from Lord Kitchener, which was followed by a hearty appreciation from the Commanding Officer of the M.M.G.S. (Lt.-Col. R. W. Bradley, D.S.O.), and other officers. One of the pleasantest features in this work is the number of letters which we receive from men on active service, and which indicate in no unmistakable manner how the writers feel they have still another bond of union with this journal. Though it is a fact that the record number of 6,277 motor cyclist recruits have passed through our hands we do not parade the fact as a virtue, but rather as an illustration how *The Motor Cycle* has proved a national asset in this time of stress, in directing keen recruits to the proper and most suitable channels, besides having offered enrolment with the minimum of trouble and delay to the recruit.

Henceforward, our energies are to be directed more to the examination of men applying for the specialised sections of the Army in which motor cyclists figure most strongly, and certifying their proficiency or otherwise.

# Ladies and the Motor Cycle

Useful and Practical Dress Designs Reviewed and Illustrated.

By MAY WALKER.

**D**ISCUSSIONS on dress are ever interesting to the feminine mind, and opinions differ more if anything than on other subjects. However, the following hints and suggestions, founded on practical experience, can be followed by the lady motor cyclist without much trouble or expense.

### Prize-winning Designs.

In the first place, I would like to refer to the winning costumes in the motor cycling dress competition promoted some time ago by the *Ladies' Field*. The first prize of an open-framed Douglas spurred on riders and "would-be" riders to tax their ingenuity in dress designing, and many interesting suggestions resulted. Of the three prize-winning outfits, personally I consider that there is very little to choose, as regards practicability and appearance, between first and second prize designs. The winner of the first prize did not solve the difficulty of garb for the rider of a man's machine. Her contention was that the frame of the motor cycle be cut to fit the dress rather than the skirt to suit the mount, and, on that principle, any kind of strong, tailored costume can be worn on an open-framed model so long as the skirt is not made too long.

The second prize costume comprises an ordinary walking skirt made with buttons to unfasten down the front, such as I have previously recommended in these columns. It is comfortable and not at all unsightly when on the machine. When buttoned up, it gives no indication of being anything unusual—a small advantage appreciated by the woman rider who has no wish to attract attention when she has dismounted. For the latter reason, I would favour an oilskin coat or Burberry to cover the clothes when riding, so that when discarded the rider shows no signs of travel.

The second prize design, submitted by Mrs. Mortimer. It can be used on a lady's or man's machine.

The practical and attractive outfit, awarded first prize in *The Ladies' Field* competition.

Design for lady motor cyclist's costume evolved by Mrs. Evelyn Saxby, and awarded third prize in *The Ladies' Field* competition of two years ago.

A lady motor cyclist wearing the adaptable hat and the "Striside" skirt. The former is an all-purpose type of headgear. For riding in bad weather the ends may be twisted round the neck and fastened by the cord to buttons, so affording protection for the ears.

## Ladies and the Motor Cycle.—

The "Striside" skirt—a practical garment for walking or motor cycling.

The "Striside" skirt is a sensible garment made by Messrs. Harrison and Co., of Hammersmith, with a corset top and a divided skirt which falls into graceful folds both on the machine and off. It is especially suitable for long journeys when a change of garment at the end of the day is possible. It is really a combined motor cycling and walking skirt and will appeal to many.

An oiled silk mackintosh would be ideal for motor cycling if it could only stand hard wear. It is lightweight, soft, and pleasant to wear, but it must be left for the sidecar passenger, whose movements are less calculated to tear it. With a woollen coat beneath it the wearer is warm and impervious to all kinds of weather. The ordinary kind of oilskin coat, with a belt for the waistline, is the best coat for the

rider, and a sports coat beneath is better than the cloth coats suggested by competitors in the competition referred to above.

## Hats.

The oiled silk hood shown on the right is the best contrivance I have found for keeping a hat in place, and free from dust and rain. Any small hat could be comfortably worn under this. Or if the silk hood be worn over the adaptable hat that I have shown a neat winter headgear is possible. The hood is made to fasten under the chin, and is a far better shape for ladies' wear than the ordinary sou'-wester. The softer material, too, allows it to be rolled up for the pocket, where it takes no more space than a handkerchief. This hood, too, makes the usual veil unnecessary. I have seen no other hoods advertised than those I myself possess, so I venture to give the address of the manufacturers, Messrs. Anderson and Abbott, Harpenden, Herts. The hoods are made in many charming shades and sold at a nominal figure.

## Gloves and Goggles.

For summer wear, reindeer gloves are strong and not too weighty, but in winter I have found nothing to equal the wool-lined fur-backed leather. A good pair can be bought for about half-a-guinea. I do not favour gauntlet gloves. They are not so warm for winter and unnecessary for summer.

Personally, I rarely use any protection for the eyes, but I quite understand that some riders would find goggles necessary. I dislike

Ordinary oilskin coat for driver and oiled silk coat for passenger. Both driver and passenger present a neat appearance and are ready to face the worst elements.

glass goggles, and if I used any they would be the mica ones, bound with chenille suggested by one of the *Ladies' Field* winners.

## The Importance of Suitable Footwear.

Spat puttees over brown leather boots provide the warmth and protection needed in winter, while the stout-soled brogue shoe is sufficient in summer.

Efficient mudshields are necessary if the lady rider is to keep her clothing free of mud splashes on a winter's run. The type illustrated above, allowing cooling air to pass to the engine through the centre opening, has proved very satisfactory in practice on our lady contributor's machine.

In conclusion, I may refer to the illustration of a mud shield made of hammered tin which is a combined protection for both rider and machine. It is at present fitted to an Ariel that I sometimes drive, and which is used in all weathers and over all kinds of roads.

An attractive drawing which appears on the cover of the 1916 catalogue of the Harley-Davidson motor cycles, just issued. This catalogue, incidentally, is well got up, and is quite out of the ordinary, having an index arranged according to the marginal headings on the right-hand pages.

# POT-POURRI.

## A DOCTOR'S SUGGESTED DESIGN FOR A TOURIST MACHINE.

**I**N this article I have endeavoured to outline a design for a 4 h.p. fast tourist machine, utilising for this purpose various "good things" which I have come across at one time or another. I hope the gentlemen responsible for the various parts I am making free with will pardon this summary dissection of their products. My apologies are due principally to Mr. Scott. He will have the satisfaction of knowing that my attempt at "painting his lily" is due to a keen admiration for his machine.

The desiderata for a fast touring machine, to my mind, are (1) "road worthiness," under which heading come efficient springing, good steering, and freedom from skidding propensities. (2.) Ability to stand the racket of sustained speed. In other words, *stamina*.

I shall now endeavour to outline the machine I should like to build.

I would start with a Scott frame. A fairly wide riding experience has taught me that no diamond-frame machine can surpass the Scott open frame for the aforementioned "Roadworthiness." To this frame I would fit Druid forks, replacing the upper pair of rigid links by a pair of Terry's spring links. This springing gives excellent results, both from the steering-comfort point of view and from that of tyre wear. The rear stand would be of the spring-up variety as fitted by Norton and by Rudge-Whitworth. Why this simple, efficient, labour-saving type of stand is not universal passes my comprehension.

Front and back wheels would be built up with Roman rims (flat base), heavy gauge spokes, and genuine water and mudproof hubs.

Both wheels would be easily detachable by undoing not more than two nuts, without disturbing brake mechanism.  $26 \times 2\frac{1}{2}$  in. tyres should ensure freedom from puncture trouble.

### The Engine.

Obviously, the simplest course is to stick to the Scott engine and radiator, and on this basis I will proceed. Everyone knows the Scott is a water-cooled twin two-stroke, fitted with an outside flywheel and two driving sprockets.

A three-jet Binks carburetter would supply my engine with the necessary gas. I would further suggest that an induction pipe be cast integral with the engine instead of using the stub adapter as is necessary on present models. This would avoid air leaking troubles, which I found inseparable from this fitment, as the induction pipe has to support the weight of a heavy carburetter. As a result vibration sooner or later loosens the joint.

The radiator and connections, to my mind, are ideal—simple, efficient, and neat.

The exhaust I should conduct to the extreme rear of the machine by large bore piping direct from the exhaust manifold. If desired small silencers could be fitted there. Back pressure, so fatal in a two-stroke, would be markedly eliminated thereby.

### Transmission.

A countershaft gear box providing three speeds is essential for tackling anything in the way of bad hills with absolute confidence. I would therefore adopt a three-speed gear box, for preference a Sturmey-Archer with handle-bar-controlled clutch. The difficulty with this fitment would be the matter of alignment of the chain and belt, as the chain drive would be taken from the left-hand sprocket to the gear box and from the gear box to the back wheel by belt (1 in. section). I purposely chose

belt for the final drive because of the simplicity and easy removal of the back wheel allowed by this system. A countershaft gear box, as delightful to use as the Sturmey-Archer and designed for this particular machine, would be ideal. On the off side, well shielded by the crank case, I would place the magneto, taking the drive from the right-hand engine sprocket. If possible a positively driven oil pump might be worked from the crankshaft on the off side as well. This pump would be the heart of the lubrication system as fitted to the 3 h.p. Enfield twin. The glass oil reservoir could be situated behind the petrol tank. In addition, a tell-tale oil flow indicator on the down tube in front of the rider would acquaint the rider of any stoppage of circulation.

For a magneto I plump solidly for the British C.A.V. I want nothing better. In the course of my runs I occasionally meet on the road riders whose magnetos "are too proud to spark." Hence my preference for the British article.

A machine built somewhat on these lines would, to my mind, be a success. Detail fitments are largely a matter of personal taste. These I have left alone. Mudguarding could be improved by the enclosing of the top half of the rear wheel on both sides with light, easily detachable shields. In the front shields *à la* Scott are quite efficient. An improvement would be the fitting of a light aluminium undershield, as in car practice, extending to the extreme width of the footrests and from the engine to behind the gear box, so protecting not only the rider's feet but all working parts of the engine and transmission.

M.B.

Design for tourist machine outlined by writer of this article.

## OCCASIONAL COMMENTS.

By "IXION."

**Standardisation!**

I happen to be busy experimenting with a number of carburetters. Of course, I expected that I should need a different petrol pipe for each vaporiser; I do not grumble about that, as I don't wish ingenious designers to be hampered by such arbitrary factors as a fixed location for the entry of the feed pipe into the float chamber. But, not being experienced in the manufacturing sides of the industry, I was a little surprised to find that I needed a store of about a dozen different coned unions and nuts to be sure of fitting up my various gasometers on one and the same motor bicycle.

**My Dimming Dodge.**

Mr. R. O. Clark's dimming disc is the idea of a mechanic; mine the notion of a sempstress. But I flatter myself that mine can be slipped into a pocket very handily. I need mine for the localities where one thickness of tissue paper is enforced, and it consists of a muslin bag, covering the entire lamp, and drawn tight by strings threaded in a deep hem at the back. It is split up both sides, so as to clear the bracket arms; the string is divided and fitted with a spring-eye coupling. It seems to satisfy the police. Moreover—but this is strictly *entre nous*—I think it allows more light to filter through than the Home Office tissue paper; but that is as may be.

**Improving Two-stroke Carburation.**

I wonder how many of my readers have discovered that two-stroking at slow speeds is improved by fitting some form of atomiser over the spraying nozzle? Apparently the engine suction at low speeds is insufficient to vaporise the petrol properly, and one is apt to get a lumpy mixture, so introducing one more factor in favour of the perfect combustion—I had almost said of "an incombustible mixture." Some carburetters fitted to these mounts are already equipped with special atomising fittings—the brass pepperpot of a B. and B., the drilled penthouse of an Amac, and the cross funnel of a Senspray. But if any reader is using a plain, open-mouthed jet on a two-stroke, he should try the effect of adding an atomiser. I believe Terrys supply a coiled wire contrivance which can be slipped over such jets. It makes for economy and regular firing at low speeds.

**A Mixture Knock.**

I have been running in a new engine, which was delivered in rather a stiff condition; and after the first hundred miles or so, a knock developed, perceptible especially when climbing hills slowly, or picking up after a corner. As such knocks seldom cure themselves, I took the engine down, but without finding any ostensible explanation, and it was with rather a baffled sensation that I put everything together again. Pending this examination, I had postponed certain slight attentions to the carburetter, which had seemed well adapted to the pristine stiffness of the engine, but ceased to afford even acceleration as the bearings bedded home. Still musing upon the mysterious knock, I set to work on the carburetter, and when the readjustment was complete, hey presto! my engine knock

had disappeared. I do not state these facts with any dogmatic confidence in the implied solution. On the face of it, it looks as if the knock was ascribable to bad mixture, and was analogous to the hill-climbing knock which every novice soon learns to cure by shutting his air lever a trifle; or perhaps I should say "soon learnt," as this particular knock is much less evident with the modern semi-automatic carburetter than it was with the old "sensitives." My favourite crony scouts the implied conclusion, on the ground that the engine, when stiff and new, would require an over-rich mixture, and that I must have weakened the mixture when I reset the vaporiser. Unfortunately, I do not know whether this is so or not, as I stuffed in the only spare jet I had before experimenting with a broach, and the spare jet happened to suit; nor can I find the old jet for purposes of comparison. However, on the chance of the facts being as they appear, I should value some technical explanation from a reader learned in the ways of gases; adding a proviso that the Editor will not allow the time-honoured discussion on knocking in all its forms to be revived just yet.

**A Disgruntled Australian.**

The post has just brought me an extremely irate letter from a pseudonymous Melbournian who purchased a Low generator, largely as the result of my jottings upon it, and met nothing but trouble. I wish it were less libellous, as I should like to share the pleasures of its wit with my readers. His experiences are so fundamentally opposed to my own that I am left to speculate as to their origin. Is he one of those uncanny individuals for whom nothing will ever come off, resembling, in a motoring sense, a friend of mine, who is always brought to death's door if he unwittingly eats a dish with eggs in it? Or has he been genuinely unfortunate and got hold of a seriously faulty generator? Or has his sample been badly knocked about on its long journey to him? Two of his points I commend to the notice of the manufacturers.

He complains that the generator was supplied to him minus a bracket, and that he had to pay 5s. 6d. to have a bracket made. The generator is certainly designed to fit in the rear prong of a standard Lucas or F.R.S. bracket; but not everybody uses this bracket. Firms who sell generators minus lamps, especially at a high price, would be more popular if they gave the option between the existing Low type and another type with a single arm top tube holder. Lastly, he emphasises the difficulty of maintaining a gastight joint between the broad flat rim of the container and the top. In this I thoroughly agree. I have struck the same hoodoo, and have removed the standard rim in favour of a narrower type. My correspondent has soldered a double ring of brass wire round the rim to give the rubber washer something to bite on—this is a simpler cure than my process. He has further removed the spring above the rubber bellows valve; I warn him that this will lead to trouble, as there is now no particular reason why the bellows valve should close when more water is required to be put in.

## The Best Motor Cycle War Story.

\* "Adventures of a Despatch Rider."

**C**APT. WATSON, a Balliol man, decided on July 25th, 1914, to take part in the Great War.

When Great Britain came in, and he read in the papers that the War Office wanted motor cyclists, he decided that a motor cyclist he would be, so he went straight up to Great Portland Street, and arranged to buy himself a mount. At 4.45 p.m. the same day he was a corporal in the Royal Engineers. We have not met the author, but we can imagine him to be the best type of man who rides a motor bicycle. He tells his story in a very human way, and in an easy pleasant style which shows he possesses literary ability in no mean degree. It is the first instalment of the motor cycle despatch rider's history of the war, extending from the time war was declared until well into last year, when the romance of the D.R. faded, owing to the fact that both armies had retired to their earthen burrows. Those gallant lads saw life in those days; they retreated and advanced, and then changed their quarters. Much happened in that period, all of which the author relates in a manner which calls for sincere admiration. It is indeed good reading. How the men left Ireland and landed at Havre brings back sad memories of an old friend, one of the first motor cycle officers in the Army who went through it all, and has now earned his well-deserved rest along with one of the Cecils to whom the author refers later on.

### The First Shell.

It was near Mons. "We had already heard guns, but on my way back I heard a distant crash, and looked round to find that a shell had burst half a mile away on a slag-heap, between Dour and myself. With my heart jumping against my ribs I opened the throttle, until I was jumping at 40 m.p.h. from cobble to cobble. Then, realising that I was in far greater danger of breaking my own neck than of being shot, I pulled myself together, and slowed down to ride sedately home." Brave deeds were done by the D.R.'s in those early days. "Huggie took a despatch to the 13th, and returned under very heavy shrapnel fire, and for this he was very properly mentioned in despatches." "They (the Heavies) had run out of fuses. . . so, Grimers was sent off with a haversack—mine—to fetch fuses and hurry up the lorries. How he got there and back in the time that he did, with the traffic that there was, I cannot even now understand."

During the retreat there was much that happened. "On our way we came across a deserted motor cycle. Someone suggested sending it on by train, until some-

one else remarked that there were no trains, and this was fifteen miles from Paris! At Tournan, appropriately, we turned. We were only a few miles S.E. of Paris. The Germans never got farther than Lagny. There they came in touch with our outposts, so the tactful French are going to raise a monument to Jeanne d'Arc—a reminder, I suppose, that even we and they committed atrocities sometimes."

### The Advance.

After lucidly describing the great retreat and its miseries the author refers to the advance, and dilates upon the joy which filled the hearts of our gallant soldiers when the order came to go forward. "We accepted any quantity of luscious fruit, the French were more than hospitable at that time. . . In a quarter of an hour Maj. Hildebrand (now a colonel and recently mentioned in despatches) . . . turned up in his car." How glad the inhabitants were to welcome our men when they came to those villages which the Germans had so rapidly evacuated. "A small girl of about eight brought me her kitten and wanted to give it to me. I explained it would not be very comfortable tied with pink ribbons to my carrier. She gravely assented."

Earlier in the story one despatch rider went off on a mission and was never seen again. During the advance another met his death. "He crashed into a German barricade, and we found him next morning

**EASTWARD BOUND!** A group of R.E. despatch riders, who have lately completed their training in the Bedfordshire district, now en route to the Near East.

\* Captain W. H. L. Watson. William Blackwood and Sons, 5s.

## The Best Motor Cycle Story.—

German prisoners employed for road cleaning and repair in France. The British despatch rider on the left says the Germans are quite happy on this work, and no doubt prefer it to idling

with his eyes closed, neatly covered with a sheet, in a quaint little house at the entrance of the village of Doué."

**Riding under Fire.**

"A clever despatch rider may reduce this to a fine art. He knows exactly at which corner he is likely to be sniped, and hurries accordingly. . . . He does not race along with nose on handle-bar. That is a trick practised only by despatch riders who are rarely under fire. . . . The experienced motor cyclist sits up and takes notice the whole time. He is able at the end of the ride to give an account of all he has seen on the way. . . . On a motor cycle, if you are going rapidly you cannot hear bullets or shells coming, or even shells bursting unless they are very near. Running slowly on top with the engine barely turning you can hear everything."

**Not a Tragedy of War.**

The scene was a deserted and much battered village. "My engine silent, I could only hear a little whisper from the houses opposite, and a dripping that I did not care to understand. Farther on a house had fallen half across the road. I scarcely dared to start my engine again in the silence of this desolate destruction. Then I could not, because the dripping was my petrol, and not a slaughtered animal. A flooded carburettor is a nuisance in an unsavoury village." The English Tommy taught the French much they did not know of their own language. "If you pronounce Hinges in the French fashion; you give forth an exclamation of distressful pain. The name cannot be shouted from a motor cycle . . . so we all called it plainly and bluntly Hinges, as though it were connected to a door." The inhabitants noticed this. Thinking that they and their forefathers had been all wrong, for surely these fine men with red hats knew better than they, the English pronunciation spread.

—The village became "Ingees, Le Cateau is Lec Catoo, Boescheppe is Bo-peep, Ouderdon is Eiderdown," and we may add that Villers-Cotterets is Villager's Cottages.

Those motor cyclists of the famous fifth division saw much service. Mons, Le Cateau, Crepy-en-Valois, the Marne, the Aisne, La Bassée, the Defence of Ypres, St. Eloi, Hill 60, and the Second Battle of Ypres. Truly a fine record." In connection with the attack on La Bassée, the writer says: "I was sent with a message for the Devons. It was the blackest of black nights, and I was riding without a light. Twice I ran into the ditch, and finally I piled up myself and my bicycle on a heap of stones lying by the sides of the road. I did not damage my machine. That was enough—I left it and walked." On getting his commission in the cyclists, Capt. Watson writes, "I had worked with the others for nearly seven months, with Huggie, who liked to be frightened; with George the arch scrounger (forager); with Spuggy, who could sing the rarest songs; with Sadders, who is as brave as any man alive; with N'Soon the Dashing, of the tender skin; with Fat Boy, who loves 'sustaining' food and dislikes frost; with Grimers and Cecil, the best of artificers; with Potters and Orr and Moulders and the Flapper. I cannot pay them a more efficient tribute than the tribute of the Commander-in-Chief. 'No amount of difficulty or danger has ever checked the energy and ardour which has distinguished their corps throughout the operations.'"

And so ends the best unfinished history of the despatch rider, and the finest tribute to the pastime since the motor cycle was.

"I DON'T WANT TO BE A JUDGE!"

An amusing photograph taken at a Services competition. For the benefit of overseas readers it may be explained that the letters on the nose of the sidecar stand for Headquarters Constabulary Detachment (London).

## Extracts from Overseas Letters.

AFRICA

AUSTRALIA

### The Opinions of Motor Cyclists scattered all over the World.

**W**E continue the feature, commenced last month, of quoting extracts from letters of readers in far-off lands. We pride ourselves upon a continuous inflow of communications from keen readers of *The Motor Cycle*, and a not inconsiderable percentage are from men in the British Empire Overseas. A study of the opinions expressed adds emphasis to several well-known facts, among them the desirability of rear springing, stronger rims, larger tank capacity, and larger tyres. One Antipodean correspondent brings up a simple point which is very often overlooked by manufacturers, that is the desirability of arranging the carburetters to provide plenty of extra air, seeing that the machines are to be used in much hotter climates than that which exists at home. The average novice does not know how to correct these simple matters, even if he desired to "tinker" immediately he had taken delivery of his mount.

As regards the items to which attention is directed with a view to strengthening the different parts, it is hardly likely that the majority of makers will need impressing with this fact when normal outputs are resumed, seeing that they are having the benefit of exceptional experience in the war zone, the conditions here constituting the nearest approach to the state of affairs in Oversea Dominions. As a natural result sturdiness will be the keynote in the design of new models after the war.

Overseas readers are constantly writing and asking if it would not be possible for manufacturers to put the prices against the various articles they advertise. One writes from Penang: "It means nearly three months to obtain such information, then add another three to write and get one, and nearly a year has gone."

#### Prices of Machines.

MR. M. STOLTENOFF, Hunters Hill, New South Wales: "I think that the prices of some of the modern English machines on the market here are most extortionate, and can never see where the value comes in. For example, for a modern Chater-Lea here agents are asking £130, whereas for the best American machine they are only asking £85 with just the same fittings. There is no doubt, in my opinion, that the American machines will get a very strong hold on this market before long, especially as some of the best riders here are giving up English machines for American ones."

#### Suitable Finish.

MR. E. CLARKE, Christchurch, N.Z.: "I own two motor cycles, a 2½ h.p. lightweight for solo work, and a 3½ h.p. twin for sidecar. The finish of the lightweight is black, while the other is khaki colour. My experience is that the neutral colour is more suitable for conditions out here than black. In dry weather, after cleaning my black-finished machine, a very short ride makes it look just as bad as

before it was touched, whereas with the other machine I may neglect it for a considerable time, and its condition is hardly noticeable.

"So far as New Zealand is concerned, sole agencies are a curse to motorists. My own machine is a very good one, but after the treatment I have received, I shall not be able to purchase another of this make in the future."

#### American Machines.

MR. C. WEATHERLAKE, Newcastle, New South Wales: "I have been riding motor cycles since 1903, and in the course of my business as a traveller cover some 12,000 to 15,000 miles per annum over some of the worst roads in Australia. I have a new bicycle every year, and at present am riding an 8 h.p. three-speed Harley-Davidson, which, after 4,000 miles, is in perfect condition, and is as good as new. This, for our roads and my work, is the best machine I have ever had. I can ride 200 miles in the day, and at the end of the run not a drop of oil is visible on the crank case.

"I may state that *The Motor Cycle* is eagerly read when I return to Newcastle every week."

#### Transmission Troubles.

MR. W. HILL, Bathurst, New South Wales: "As to the 'Chain v. Belt' question, I will not attempt to argue as to the well-known merits of each, but in this part the belt is more popular. When chains are in use they should be totally enclosed. Where the chains were not enclosed I know of a couple of instances where the machines needed the sprockets renewing every twelve months.

"Rear springing would be welcomed by Colonial riders, to whom a fifty-mile trip over some of the Australian main roads is something to be dreaded. It should be strong and durable, however, and not too flexible. Too much of the latter would be worse than none at all.

"There are a number of other details which I will mention, about which no argument is required, such as improved lubrication, wide handle-bars in preference to the narrow English touring type giving so little control when ridden solo, good mudguard clearance, large toolbags, well armoured, and at least 2½ in. tyres."

#### Manufacturers' Prices.

MR. IVOR F. MUNRO, Cootamundra, New South Wales: "Advertisers of accessories should quote weight (packed) of their speciality. This may seem a small matter (and so it is), but it may mean the sending of an order or not. For instance, I would like to experiment with a certain carburetter. The makers advertise the price of the carburetter in England. The carburetter possibly weighs, say, 2 lb. It may be packed in a card box weighing a further few ounces, or it may be put up in a solid wooden box (for safety in transit) weighing more than the article being sent. Regarding local prices, I am afraid the only way to lower these appreciably would be for an English manufacturer to open a branch here and do away with the agency. As it is the articles have so many profits to be added to them that they always seem to be attached to an aeroplane—a high flying one at that. I have been riding a Bradbury 3½ h.p. single since 1912, both for business and pleasure, over all classes of country. The only time I have been 'left' by it was when a motor car ran into it and broke the front forks. It has plenty of clearance, a sturdy

## THE Spring Frame Motor Cycle

— the machine that solves finally and for all time the springing problem. Note its specification:—

ENGINE—2 $\frac{1}{2}$  h.p. J.A.P. single-cylinder, bore and stroke 70×76, cubic capacity 292 c.c. GEAR—Enfield 2-speed gear incorporating patent slipping clutch and cush drive. CARBURETTOR—Amac, straight through type. IGNITION—Variable, M.L. enclosed pattern, handle-bar control. TRANSMISSION—Entirely by Renold chain, giving smooth drive in connection with cush drive in back wheel. LUBRICATION—Best & Lloyds semi-automatic drip feed to crank-case. FRAME—Edmund patent adjustable spring frame made throughout of special reinforced tubing; springs can be adjusted in a few minutes to suit, exactly, weight of rider. Shock absorbers incorporated in compression bars. FORKS—Druid. TYRES—26×2 $\frac{1}{4}$  Avon (Druid type). BRAKES—Powerful foot brake on brake rim, large Bowden on front wheel. FOOTBOARDS—Footboards are fitted as standard, specially strong cranked footrests when specified. TANK—Double tank attached to top bar, pannier fashion; this member being sprung, petrol and oil are conveyed from their respective tanks by petrol-proof rubber tubing (in conjunction with copper tubing) as used by the British and French Governments on flying machines. Capacity: 1 $\frac{1}{2}$  gall. petrol, and 1 qt. oil. SADDLE—Specially padded pan-seat without springs, no lateral play possible. CARRIER—Strong semi-sprung carrier with two pannier tool bags and tools in tool roll. FINISH—All-weather finish (black); all bright parts heavily plated.

**Price 44 Gns.**

**C. EDMUND & CO., LTD.,  
Crane Bank, Chester.**

## Extracts from Overseas Letters.—

engine, and a solid frame. I average, by speedometer, 6,000 miles per annum. Engine oil costs from 5s. 6d. to 8s. 6d. per gallon, petrol 2s. 6d. to 3s. (I think it is about 1s. 10d. in Sydney), valves 7s. 6d. each (without springs, cotters, etc.), 26×2½ or 2½ tyres, four-ply, £3 10s. each, and tubes 16s. By the way, mudguards should be made so that mud can be removed without detaching wheel."

## Road Dangers.

An officer on H.M.S. *Warspite* writes: "One of the greatest dangers on Australian roads are travelling flocks of sheep, which occupy the entire road, and at night are invisible until you are on top of them. If the drovers were made to carry a lantern or light of some sort many accidents would be prevented. I had an unpleasant experience, running into a flock in charge of a drunken drover. Fortunately, no damage was done, but a short brawl ensued before I was allowed to pass through the flock. These incidents are unpleasant, as there is no possibility of help, and if the drover chooses to be obstinate it is impossible to get on. The Zenith machine is about the best for Australia, as it is strong, well sprung, and a variable gear is essential on account of steep hills, which usually have a bad surface and must be climbed slowly. A popular machine is the 7-9 h.p. Indian, but, personally, I prefer the Zenith."

## They're all Good!

MR. C. STOKELL, Canterbury, New Zealand: "Concerning the type of machine most suitable out here, I do not think motor cycles could be restricted to one type, or ten as far as that goes, for all have their advocates, whether they be single or twin, heavy or light, chain or belt drive, and all find a ready market at a pretty stiff price. If a motorist is asked what is the right clearance, or any other detail, he cannot tell you in inches, but points you out his new cycle, and tells you it's 'just right'; it may be anything from three to six inches. Any ordinary standard model seems all right for this district. As far as I can see, the rims, which are far too light, are the weakest spot in most of the machines; they dent badly and frequently part at the brazed joint if ridden hard over main roads, loose stones accounting for this. The ordinary rim as fitted to most bicycles weighs about two pounds; a rim weighing four pounds with welded joint and built up with ten or sixteen gauge spokes makes a very fair wheel which will stand a good deal of fast riding. Rear springing is another detail which needs attention, but should not be constructed

regardless of weight as at present, with half a cart spring or two stuck on anywhere, but something light and simple, employing open coil springs of the Druid pattern which take both thrust and rebound silently and effectively. Designers of two-stroke engines who study economy should connect the release valve to the crank case instead of the exhaust pipe, for these engines as at present constructed continue to pump through as much gas when cut out as under working conditions; of course, the carburetter could be closed, but this is not done by most riders. Fixed-engined two-strokes when used for hard work in the country are belt destructors pure and simple. To make the belt grip when wet it has to be strained so tightly that it often breaks in the first run; also, the small end bearing seems to cut out very soon. There is a scarcity of 3½ h.p. twins on the Christchurch market, 3½ h.p. being the all-round bicycle here. Some riders swear by the single, but the fact that the twin seems much less liable to knock than the single puts it high in my favour. Lamps go fairly well when new, but after a while seldom give satisfaction, the gas blowing back through the water under the slightest provocation; they are my brother's pet grievance, and so sore is he on this point that he is making one in which the water is forced into the carbide under pressure—with such an arrangement, there being no chance of blow back, there should be 'some' light. Most roads in Canterbury are very flat, and a fair amount of sport can be had from any old machine."

## Riding Conditions in N.S.W.

MR. J. A. SIMPSON, Parramatta, New South Wales: "I have been taking your publication for several years, and may state that both my daughter and I read it thoroughly. My daughter has ridden since she was seventeen years old, and was, I believe, the second lady in Australia to obtain her rider's licence, the palm being carried off a few weeks earlier by a lady in Western Australia. My daughter has always taken a thorough practical interest in her motor bicycle, being able to dismantle and reassemble her machine, and knows more of motor cycles than many men on the road. It seems to me that English makers will have to look out for the American makers. As a sample: a well-known English twin of 6 h.p. now costs £115 in Sydney, while you can buy an 8 h.p. American at £85, and several riders that I know speak most highly of this make. My experience with back tyres (driving), when used for sidecar work, is that makers do not fit large or heavy enough tyres. I had two covers 650×65 not worn out, but cut through the walls in no time, which comes about by the fact that you cannot inflate enough to stop a roll when turning, and have now put on a 710×90 (on same rim), and have had a delightful time, with no punctures and no heartbreaking gashes. The clearance on sidecars, to my mind, is not high enough, and at least 5½ in. on bicycle is required. It is a marvel how machines stand up to the work on the roads about Sydney, which are the worst I ever struck—I know Melbourne, Victoria, and also South Australia—and speaks well for the makers of motor cycles. Makers of carburetters do not give sufficient extra air either on bicycles or cars. For instance, my machine came out with an Amac No. 30 jet and float chamber at back of jet chamber. I altered to 28 jet, put float chamber to front, drilled five holes ⅜ in. (vertical) in mixing chamber, and, in place of split pin holding needle above float, put another 50% wider to reduce lift of needle valve on account of rough roads. I have always ridden my Matchless with sidecar and 11 stone passenger. Given a fair road and average hills I do from 60 to 64 m.p.g. heavy benzine. Sidecars are very much on the increase, but I do not think anyone out here would attach a sidecar to any bicycle of less than 6 h.p."

[A further selection of overseas riders' opinions will appear in the first issue of March.—Ed.]

Wounded South African soldiers who were taken for an afternoon's run by Cape Town motor cyclists. Some of the sidecar outfits that were used may be seen in the picture.

# A 422 c.c. Horizontal Levis.

A New Type Engine  
used for Admiralty  
Purposes.

**H**ARDLY an engineering firm exists to-day but which is busily engaged in munitions of war of one sort or another, and, as we have pointed out on several occasions, motor cycle manufacturers are no exception to the rule. If it is not shells, it is aeroplane parts; if not aeroplane parts, it is field kitchens; if not field kitchens, hand grenades, and so on. But two or three selected firms—significantly enough, those producing horizontally opposed motor cycle engines—are busy in the manufacture of blower sets used for inflating airships after descent in order to keep the fabric stretched. Last week Messrs. Butterfields, Ltd., of Stechford, near Birmingham, invited us to inspect a batch of these sets going through their works.

On entering the test room we saw a mechanic get to work at the starting handle, and in three turns the little two-stroke Levis belched forth a raucous note what time the blower commenced operations sweeping up paper, shavings, and sending over small crates which were disposed about the floor, so strong was the draught produced. Mariners talk with bated breath of North Sea gales, but we should imagine it would be good practice for men of the R.N.V.R. to stand near a healthy Levis blower and imagine themselves on the bridge.

The engine fitted to this blower set is an entirely new one, and has not previously seen the light of day. Certainly it is but a reduced facsimile of the 5-6 h.p. horizontal twin which secured a notable success at Style Cop on its first appearance last autumn. This latter engine had two cylinders of the 2½ h.p. size, each of a capacity of 348 c.c. The new engine fitted to the blower has two air-cooled cylinders of the 2¼ h.p. Popular model Levis, giving a total capacity of 422 c.c.

The set is built on a flat iron base, the blower being supplied direct to the Levis Works by the Admiralty. A square petrol tank, holding one and a half gallons, is fitted above the blower casing, and at the rear is a cylindrical oil tank, the feed being governed by an ordinary B. and L. lubricator. From this lubricator there is an oil lead to each side of the crankshaft bearing, and another through a separate sight feed lubricator with an adjustment screw, this lead conducting oil to each cylinder, and again branched to feed each side of the hollow

Levis blower set for inflating airships. The engine is a new horizontal twin two-stroke of 422 c.c., which will later be used in a new model Levis motor bicycle.

gudgeon pins. A C.A.V. single-pole magneto is used, which necessitates the fitting of a two-pole Lodge plug to one of the cylinders, on account of the fact that, a two-throw crank being used, the cylinders are arranged to fire simultaneously. A marine type Amac carburetter is fitted, which gives wonderfully easy starting from cold in the two instances of engine sets which were started up for our inspection. It may be interposed that the handle starting is arranged direct on the engine-shaft. It will be seen from the illustration accompanying that the flywheel is enclosed in the blower casing, the runner of the blower being coupled direct to the crankshaft. The shaft is a plain two-throw stamping of Ubas steel without balance weights of any kind, the fact of the two cylinders firing together providing almost perfect mechanical balance, though, of course, the firing torque cannot be so good as an engine having even firing.

## A New Horizontal Levis Promised.

Naturally, our conversation with Mr. W. H. Butterfield turned to the possibility of the engine being used in a motor cycle frame, and we were told that already one of the 422 c.c. engines had been tried on the road in a frame, and had given great promise, its most notable achievement being the ascent, on a 4¼ to 1 top gear, of Ankerdine Hill, which is a fairly long and tiring ascent of about 1 in 8. Messrs. Butterfield have every intention at the moment of adopting this 422 c.c. model as a standard Levis production, and were it not for the needs of the Admiralty one of these sets would very quickly be mounted in a finished frame with a view to prolonged testing, but that desirable step must be postponed for the present.

The larger 5-6 h.p. engine, the size of which we have already given, will ultimately be water-cooled, and will almost certainly figure in a light cycle car anon.

There is usually something to see of interest at the Levis Works, and on the occasion of the present visit, after examining the blower set, we were invited to witness sidecar stunts on the Levis test hill. It will be recalled that this test hill is an artificial one running to the roof of the Levis Works, the gradient being as steep as 1 in 3. It was originally intended for motor bicycles, but a 2½ h.p. model Levis with an Enfield gear, having a low ratio of 14 to 1, has now been fitted up with a light sidecar attachment, and the venturesome may enjoy the hair-raising experience of being shot up the hill with barely three inches to spare on either side. Keen though we are to try any new motor cycle, we preferred on this occasion to remain in the guise of an onlooker. Accordingly Mr. Butterfield produced two men out of the works to occupy the sidecar seat, and the little Levis tugged the three to the roof quite comfortably.

Dimming a lamp to comply with the "Lights Order" section of the new lighting regulations. Instead of tissue paper a muslin bag is fitted over the lamp—a method which can be recommended for electric lamps, though hardly safe for acetylene. This is the plan referred to by "Ixon."

## OVERSEAS GOSSIP.

## Motor Cycle Doings in the Empire Overseas.

## Indians in Australasia.

THE Hendee Manufacturing Co., we understand, have made an important alteration to their Australasian business, it now being transferred to a local company, controlled by Mr. J. H. Rhodes, with headquarters in Melbourne. The Hendee Co.'s Melbourne branch is consequently closed, and Mr. T. K. Hastings, who looked after the firm's Australasian interests, has returned to the United States to take up other important work on behalf of the company.

## Royal Enfield Wins in Spain.

A 3 h.p. Royal Enfield won the King Alfonso Cup in the International Motor Cycle Trials recently held in Spain. The 35 kilometres (roughly 59 miles) was covered in 1h. 52m. 31s. (=32 m.p.h.).

## Membership of the Cape Peninsula Club.

Membership of the Cape Peninsula (S.A.) Motor Cycling Club shows a slight falling off, according to the annual report issued at the end of the year. This is not surprising in view of the war, and when hostilities are over the membership roll will doubtless go up once more. At present there are 241 members, and the club's bank balance amounts to £116.

## 490 Miles Trial in New South Wales.

Results have just come to hand of a twenty-four hours reliability trial held over an out-and-home course from Sydney, N.S.W. The test included the ascent of the famous Blue Mountains, and the total mileage was 402. First three places were secured by the following, all of whom used Dunlop tyres:

- A. Biden (8 h.p. Harley-Davidson sc.).
- J. Audsley (3½ h.p. P. and M.).
- A. E. Thomas (4¼ h.p. B.S.A.).

## The British and American Export Trade.

A graphic illustration of the manner in which American motor cycle manufacturers are getting the British overseas trade now that exports of motor cycles from this country are necessarily limited (on account of war demands) is furnished by a statement issued by the Hendee Manufacturing Co. This is to the effect that during the months of October, November, and December, 1915, the foreign shipments to countries

outside the war zone or Canada have exceeded the entire shipments of the company's last fiscal year.

## Hill-climbing in Victoria.

The Victoria (Australia) M.C.C. hill-climb at Wheeler's Hill, near Melbourne, proved an unqualified success, and, incidentally, the supremacy of the British mount in open competition. Results:

- SOLO MACHINES UNDER 600 C.C.
- 1. E. Mayman (3½ h.p. Triumph).
  - 2. A. Cheadle (4½ h.p. Peerless).

- SOLO MACHINES OVER 600 C.C.
- 1. E. Gates (6 h.p. Regnis-M.A.G.).
  - 2. J. Booth (7 h.p. Indian).

## SIDE CARS.

- 1. J. Priestley (7 h.p. Ideal-Jap.).

There was a splendid entry list, comprising British, American, and Australian assembled machines.

## Victorian Half-mile Record.

Jack Booth, the famous Australian rider of Indian machines, has covered the flying half-mile at a speed of 81.81 m.p.h. This is the average of one run in each direction.

## The Use of Motor Cycles for Telephone Repair Work.

The British Columbia Telephone Co., who have practically a monopoly of the telephone business throughout the western Canadian province, make extended use of motor bicycles and sidecar outfits in repair work. At present the company operate with twenty machines, and these are used for the quick despatch of repair men and their tools to scenes of breakdown. The success of a telephone service depends on keeping down the number of breakdowns, and those that do occur to the minimum of time, and with the employment of motor cycles a considerable improvement has been effected in these respects.

## British Success in Canadian Hill-climb.

In the Toronto Motor Club's hill-climb at Davisville, Canada, the slow test was won by a Matchless and sidecar, the time being six minutes and a fraction, while the same machine travelling all out over the same course only occupied fourteen seconds.

## A FRENCH BY-ROAD IN WAR TIME.

This photograph, showing despatch riders on Douglases and a Rudge respectively, was taken in France, and provides a good impression of the difficulties in the way of grease and mud encountered by military motor cyclists.

## A Sidecar Outing for Wounded Soldiers.

LAST year, it may be remembered, The Motor Cycle organised, with the co-operation of a patriotic lady, a very successful sidecar outing for wounded Belgian soldiers. The reason that Belgian soldiers were taken instead of British was due to the curious idea dominant in the minds of the hospital authorities that the sidecar was not a fit and proper vehicle in which to take out wounded, the idea existing being the absurd one that sidecars "jolted."

Since those days, however, matters have progressed, and we have been successful in obtaining the very hearty co-operation of the secretary of one of the best known London hospitals—himself the owner of a sidecar combination—in the planning of another run of a similar nature. This gentleman has kindly consented to give his support to a run recently proposed by the Harley-Davidson Motor Co., Ltd., the idea being to run down in Harley-Davidson

passenger outfits to such a place as Burford Bridge a number of wounded soldiers, to whom lunch will be given, which will be followed by an entertainment, professional artists being engaged. All expenses will be defrayed by the Harley-Davidson Co. Owners of this make of sidecar living in the London district who will be able to co-operate in this very excellent scheme are invited to communicate with the company at Harleyson House, 74, Newman Street, W.

## SPECIAL FEATURES

COSTUMES FOR LADY MOTOR CYCLISTS.

OPINIONS OF OVERSEAS RIDERS.

6,000 RECRUITS.

" 9th	...	...	5.28 "

## Exclusive Week-end News.

The *Motor Cycle* regularly includes all the week-end news, which accounts to some extent for the exclusive announcements we are able to make.

## Two-stroke Engine Problems.

Any reader interested in two-stroke engines who may not have read the very practical article in our issue of January 20th, entitled "A New Design of Two-stroke Engine," by James Martin, should make a point of doing so. An interesting correspondence on the questions raised commenced on page 91 last week, and is continued in this issue. Mr. Martin will shortly reply to his critics.

## Motor Cycles in Macedonia.

Those who expressed doubts as to the use of motor cycles in Macedonia will surely politely climb down upon reading the vivid letter from a despatch rider at Salonica that appears in the Military Notes of this issue. R.E. despatch riders and their machines in the advance and retreat from Serbia were put to what is perhaps the most severe test ever yet imposed upon this section of the Army. That they surmounted such trying conditions is a credit to both riders and machines.

## Ladies' Riding Apparel.

Among the features of this issue is an article by our lady contributor Miss May Walker on the absorbing question of dress for lady motor cyclists. Striking illustrations accompany it.

## Support for our Spring Frame Campaign.

Another design of spring frame, by a leading maker is shown in an illustration this week. It is the Royal Ruby which we announced last autumn. Last week we inspected another design which was under test on the road, and particulars will appear shortly.

## America's New Type Cycle Cars.

America has produced an entirely new breed of cycle car. The Yankee notion is a miniature racing car, even the wheels being of proportionate size, the power plant being an air-cooled motor cycle engine and gear box. A series of designs appeared in our issue of June 17th last, but the very latest, a most attractive little runabout, is illustrated on page 118.

## More Free Dimming Discs.

Messrs. Joseph Lucas, Ltd., Great King Street, Birmingham, are prepared to present to users of Lucas lamps perforated discs which meet the requirements of the new Lighting Order in those districts where Part III. applies. The discs are of three sizes—4½ in., 5½ in., and 5½ in.

We have received from Messrs. C. A. Vandervell and Co., Ltd., two perforated cardboard discs, which are to be distributed free to users of C.A.V. G.C. or B.C. side lamps or motor cycle head lamps.

## Waiting List of Despatch Riders.

For the information of enquirers respecting positions in the Royal Engineers as despatch riders, we notice from particulars in our possession that practically every district committee's waiting list is up to the strength allowed by the Central Office. As soon as R.E. recruits are wanted, an announcement to that effect will appear in these columns as heretofore.

## Motor Cyclists' "Through Routes."

Our best thanks to those readers who have so kindly offered to check the routes in certain districts which appear in the new edition of *The Motor Cycle Route Book*. Proofs of the routes have now been issued to readers who have a special knowledge of the roads in certain districts, and by this means of double checking with "local" knowledge, our publishers will be able to produce a book in which the routes given are not only correct, but are the best from a motor cyclist's view-point.

## Ulster Centre Annual Meeting.

The Ulster Centre of the Motor Cycle Union of Ireland held its annual general meeting on Friday evening at the Grand Central Hotel, Belfast, combining the business proceedings with a smoking concert. The chair was occupied by Mr. R. G. Lindsay, the president. The report of the committee showed that, owing to the war and the condition of affairs generally at home, the activity of the Union was greatly curtailed, but, nevertheless a restricted programme of events was carried out. The chief of these was the Irish End-to-end two days trial, and although shorn of a good deal of its erstwhile interest by reason of the absence of the usual cross-Channel competitors, it proved a very successful event. The report gave prominence to the fact that more than half of the members of the committee were serving in the Army. The names of sixty were given in the report, and it was mentioned during the evening that thirty of them now had commissions. The financial statement was satisfactory, despite a substantial fall in the revenue. The committee was able to adjust its expenses to the existing conditions, and closed the year with a substantially increased credit balance. Both reports were adopted. The election of officers results in Mr. R. G. Lindsay being made president for the sixth time. The other officers elected were as under: Hon. treas., R. McCann, and hon. sec., J. J. Kennedy. Although the meeting gave no directions to the incoming committee on the subject of competitions, it is understood from the speeches that a restricted programme on the lines of those of last year will be carried out, including, of course, the classic Irish event—the End-to-end trial.

A STAFFORDSHIRE SCENE. Sunset on Rudyard Lake.

# Reading Standard

## Introducing — A Motor Cycle of the Highest Class Attainable.

**T**HE NEW MODEL "READING - STANDARD" FOR 1916 has earned the enthusiastic admiration of all who have seen and tried it. It embodies more real improvements and refinements than any other motor cycle. It gives great speed, great flexibility, most power, and least trouble. It is the crowning achievement of twelve years' practical experience by us in the highest class motor cycle manufacture. No better machine has ever been produced in any factory. We invite tests and comparison to prove the absolute truth of these statements.

### **NOTE these Points in the Specification of the New R-S:**

Three-speed sliding gear, with double locking device. Large multiple disc clutch, foot and hand operated. Large valve area. Motor positively oil-tight. Mechanical oiler, plunger type, driven by worm shaft, also hand pump. Step starter. New front fork (with double fork sides). New R-S "Perfection" seat pillar giving absolute comfort and entire immunity from road shocks. Heavy and reinforced tubing throughout the frame. Integral cam gear, *i.e.* gear, shaft and cams all in one piece, turned from solid bar. (Cams and gears are made of properly treated Vanadium steel.) Side-by-side valves. Powerful foot brake.

The R-S is manufactured throughout in one up-to-date factory. We give one year's guarantee. **SERVICE BUILT INTO EVERY DETAIL.** A Catalogue awaits your enquiry.

**The READING-STANDARD Motor Cycle Co.,**

28 & 29, BAKER STREET, PORTMAN SQUARE, - - - - - LONDON, W.

Telegrams: Clairmat, London.

Telephones: 508 and 563, Mayfair.

# IF YOU LIKE to hear a "click" as you change gear you don't want a **ZENITH**

The Infinitely Variable GRADUA GEAR is quite silent in operation, whilst possessing the even greater merit of permitting the engine to turn at a uniform rate (the speed at which it can most efficiently work). This represents a big saving of wear in all the working parts, belt and tyres.

**Ford Yarns.**

Wherever motor cyclists congregate it is quite the usual thing for members of the party to tell funny stories of Ford cars. It is not fair to confine these yarns to club circles, and we offer a set of three handbooks (motor car or motor cycle) for the best Ford story which is forwarded to us for publication. Here's a chance for the hundreds of readers in the trenches!

**The Junior Automobile Club.**

The above is the new title that is proposed for the body hitherto known as the Cyclecar Club. As a matter of fact, a Junior A.C. was formed as long ago as 1907 by Mr. C. W. Brown, but it has been practically dormant since its birth, hence its sponsors are willing for the title to be transferred to the present Cyclecar Club. This decision was arrived at at the annual meeting of the Cyclecar Club held on Friday last.

**O. C. Godfrey Learns to Fly.**

O. C. Godfrey expects shortly to be gazetted as Sec.-Lt. in the Royal Flying Corps. He obtained his ticket on January 12th, having begun to learn to fly on November 2nd. As a matter of fact, he was ready for his examination long before, but was unable to fly for his certificate owing to the bad weather. He learnt on a Wright machine, which, he says, is a particularly unstable aeroplane. It has no inherent stability, and, therefore, has to be controlled the whole time, consequently the pupil receives much instruction while flying. Asked if he found motor cycling of any value to him in learning to fly, Mr. Godfrey replied in the negative, and said he thought any young man with ordinary intelligence could learn to fly in a comparatively short time.

**In Aid of the Italian Wounded.**

Riders of Douglas motor cycles are attached to the First British Ambulance and Hospital Unit at the Italian front. The ambulances have carried over 20,000 sick and wounded and covered over 117,000 kilometres in seventeen weeks.

**The National Relief Funds.**

At the week-end the principal war funds stood as follows:

The Prince of Wales's National Relief Fund (£2,893,000 distributed)	£5,736,293	0	0
Tobacco Fund	97,849	0	0
Fund for the Sick and Wounded	3,123,863	0	0
The Queen's Work for Women Fund	168,330	4	9
Polish Victims' Relief Fund	97,691	14	3

**Russian Honour for British Despatch Rider.**

Corporal Gaze, despatch rider, R.E., has been presented with the St. George Medal from the Tsar for gallantry at the second battle of Ypres. In getting through to Hill 60 with important despatches he was badly wounded, and his comrade had his leg blown off. He managed, however, to deliver the message and then returned to his comrade, but was again seriously wounded, and lay all night before being discovered.

**Damages for a Sidecar Accident.**

£650 damages were awarded to Mr. J. T. Gardner in the King's Bench recently in a case against the Splidtdorf Electrical Co. It appears that in February last he purchased a second-hand motor cycle and sidecar, but never having driven a machine before he was unwilling to make his first attempt through the London traffic. The firm, therefore, directed an employee to drive him to his home at Harrow. On the way a collision occurred with a taxicab, and Mr. Gardner was so seriously injured that he had to have one of his legs amputated. The jury found that the accident was due to negligence.

A THOUGHTFUL ACT WHICH MIGHT BE COPIED.

The owner of this Matchless outfit overtook the two soldiers and a woman walking to a country station, one of the men being trenchward bound after seven days' leave. The sidecar owner insisted upon taking the three the remainder of the journey, a distance of two and a half miles, greatly to their joy.

# SPRING FRAMES—IDEAL AND REAL.

By An Amateur Designer.

**A**LTHOUGH the movement in favour of spring frames initiated by *The Motor Cycle* has set many inventive minds to work, it may be questioned whether the numerous designers, amateur and otherwise, who are attacking the problem have a definite idea of the object to be achieved and the choice of methods available for attaining the end in view. No doubt it is understood in a general kind of way that you have to protect the rider and motor cycle from road shocks, and that you do this by providing a few springs somewhere near the back wheel, but one wonders whether in many cases there is any more precise intention than this.

It is really not very difficult to make out a list of the qualities that a spring frame ought and ought not to have. A further list can next be prepared showing the various possible combinations of springs, links, etc., by which the back wheel can be supported, and all that then remains is to select the particular combination that possesses the greatest number of desirable qualities, and the least number of undesirable ones. If the winning scheme is not exactly the ideal springing device, at any rate it will be as near to it as we can hope to get.

Of course, we all know that the problem is not quite so simple as that, but is it unreasonable to suggest that some such procedure should be followed as far as possible in dealing with a question of this kind? All manner of differences of opinion are likely to arise as to the relative merits of various devices, and as to what are, and what are not, "possible combinations." Still, criticism of the schemes put forward will be much more valuable if it proceeds along definite lines, and hence the best possible solution of the problem is likely to be reached all the sooner. For example, it serves no sort of purpose to criticise a particular design because it looks as though it wouldn't be a success; on the other hand, if it is pointed out that the design would fail because, say, it would quickly allow the wheel to get out of alignment, or because the wrong kind of springs are used, then the challenge can be taken up on a clear issue, and there is some prospect of deciding whether or not the criticism is justified.

## The Ideal.

The utmost that can be said about the best device in its "paper" stage is that it is *likely* to be a success on the road: the road test is fairly certain to reveal unsuspected weak points, which can be noted in our list of "what to avoid," thus imposing still further restrictions on future designs.

To apply this systematic method of procedure to the present question, we have first to decide exactly what we expect from a rear-sprung motor cycle, *i.e.*, what are the chief items on the "desirable" side. Our aim may be expressed in many different forms, but it will probably be agreed that an *ideal* spring frame would fulfil the following condition. Assuming the motor cycle to be travelling along a road nominally level, then the rider and machine should move truly horizontally, without rising or falling in the slightest degree, no matter what humps or hollows in the road

surface the wheel encountered. When a pot-hole is traversed, the wheel must drop into the hole, but in doing so must not lower the frame or the rider; similarly the wheel must rise over an obstruction without raising the rider.

In short, the rider of an ideally-sprung motor cycle would be unable to tell from the motion of his machine whether the road he was traversing was like a billiard table or like—well, any well-worn motor 'bus route. Obviously this is one of those ideals that cannot be realised, so we must be content with stipulating that the rider is disturbed as little as possible, and that whatever vertical displacements are impressed on him (to use the language of mechanics) they are brought about with as little shock as possible.

## Pros and Cons.

Although the comfort of the rider is the first consideration, if the motor cycle itself can be made to share the freedom from road shocks that we are endeavouring to secure for the rider so much the better, and any springing device will be the more valuable according to the proportion of the total weight that is sprung, *i.e.*, the unsprung weight should be as small as possible. Quite a number of other desiderata could be brought forward, but most of these might more accurately be described as absence of undesirable features, and so should be classed among the negative characteristics.

There are so many attributes that the rear springing system must *not* have that it is difficult to know where to begin. However, a few of the more important ones can be mentioned, and the reader can complete the list to suit his taste.

(1.) There must be no tendency—or as little as possible—to "bouncing." When the springs have yielded, due to inequalities in the road surface, they should regain their normal position without undue rebound.

(2.) The back wheel must not be thrown out of alignment under any loads that are likely to be put on the machine, even when the links and pins of the pivoted members, or their equivalents, become worn.

(3.) The vertical movement of the wheel, relatively to the frame, must not strain the transmission in any way. This means that the distance between the centres of the countershaft and of the back wheel must remain unaltered.

(4.) The device should not add materially to the weight of the machine.

All these points are fairly obvious ones; nevertheless they cannot be too clearly borne in mind if a successful result is to be achieved.

## Leaf or Coil Springs.

As for the next step in the evolution of a successful springing gear—the compilation of a list of *all* the available combinations of springs, links, etc.—we are here confronted by an impossible task. To examine in detail even the suggestions that have been described in this journal would be out of the question; to select a particular example would be invidious, but it may be permissible to discuss one

**Spring Frames—Ideal and Real.—**

or two general types—for example, those employing leaf or plate springs and those using coil or helical (so-called "spiral") springs.

The main positive property that is demanded of the design practically amounts to a capacity for giving satisfaction on the road, and hence can only be decided by a road test. As regards the negative qualities, the leaf type of spring certainly has the advantage over the coil spring in the first item on the list, for the latter type is much more prone to give rise to bouncing than the former. When a plate spring deflects, the ends of the individual leaves move relatively to one another, and a reverse motion takes place when the spring regains its normal position. The friction between the plates offers a greater or less resistance to this relative movement, and hence has a material effect in damping down undesirable oscillations. Coil springs have no such damping action.

Points 2 and 3 depend more upon the method of applying the springs than upon the springs themselves, but, judged by condition 4, the advantage lies with the coil type. For a given load and deflection a coil spring can be made considerably lighter than a leaf spring, though it does not necessarily follow from this that the weight of the complete springing arrangement will be less.

**The Real.**

Perhaps a little further explanation of condition 2 is necessary, as it is from this point of view that many of the designs so far published appear to be defective. If the rear sprung motor cycle is to be used for side-car work—and presumably all machines of the class we are considering are built with this object in view

Fig. 1.

—the rear wheel will often be called upon to withstand the severe horizontal *side* thrust that is set up when the vehicle is cornering—a thrust that may in extreme cases amount to one-sixth or one-fifth of the total weight of the combination and its passengers. It will at once be recognised how easily a system of link work, designed primarily to sustain a vertical load, could be seriously distorted by a horizontal force of this nature. Take the case of machines having pivoted chain stays: the tendency of the side thrust is to force the wheel over as shown by the dotted lines in fig. 1, and consequently completely to destroy the alignment. (In this diagram the motor cycle is supposed to be viewed in plan.) To resist this tendency it is clear that the pivoted connections A between the stays and the frame must be very robustly designed, and preferably the system should be stiffened by interconnecting the inner ends of the stays. Even if the arrangement is sufficiently rigid when the joints are new, evidently any great amount of wear will allow the wheel to get out of line.

It happens that leaf springs are admirably adapted for withstanding this side thrust, but curiously enough they are usually placed where their advantages in this direction are thrown away, *i.e.*, some distance above

the centre of the wheel, instead of *at* the centre. Consequently the tendency of the side load is to twist the wheel over as shown in fig. 2; this diagram represents a rear view of the motor cycle, SS being the springs, and P the direction of the thrust. No doubt the designers who favour this method make suitable provision for preventing such distortion, but, as before explained, it is impossible to maintain the alignment of the wheel when serious wear develops in the pivots.

Fig. 2.

**A Suggested Arrangement.**

A suggestion for completely eliminating this possibility is indicated diagrammatically in fig. 3. It will be observed that the pivoted chain stays are replaced by a second pair of leaf springs

B, and as the arched member C is hence restrained from sideways movement, both at its connections with springs A and springs B, this member will have a truly vertical movement under all conditions, and so, therefore, will the wheel which is attached to it. The only wearing parts of the gear are the connections between the arched member C and the ends of the springs, and even if wear does occur at these points it cannot affect the alignment in any way.

Besides possessing, in common with all devices employing leaf springs, the advantage of absence of rebound, the arrangement shown in fig. 3 has the further point in its favour that the springing is adjustable. By screwing up the nuts D to suit the load on the machine, the ground clearance can be maintained constant irrespective of the weight and number of passengers.

Fig. 3.

No doubt it would not be an easy task to design a transmission to suit such a system of springing, but it would be interesting to hear whether all the objections that could be urged against the design would be such as to deprive it of all chance of success in a practical test. In conclusion, it may be noted that if the upper springs A (fig. 3) be removed, we are left with the simple method of suspension common in three-wheeled cycle cars. Perhaps some reader will point out whether or not this method has been tried on a motor cycle; if so, with what success, and, if not, why it should not give satisfactory results. Such an arrangement has obvious advantages from the point of view of cheapness and simplicity, and the only defect that is revealed by a cursory glance is the possibility of the wheel canting, as shown in fig. 2. In cycle cars this possibility can be guarded against by spacing the springs well apart, but this could not conveniently be done on a motor cycle.

# Developments in the American Motor Cycle World.

Mr. W. H. Wells recounts Impressions gained on his Latest Visit to the U.S.A.

**W**E recently had a chat with Mr. W. H. Wells, who has lately returned from a short visit to the Hendee headquarters in Springfield, Massachusetts. Asked about the present condition of the motor cycle industry in the United States, Mr. Wells stated that the demand for motor cycles and cars was as great as ever, but the difficulty was a shortage of material, which was almost as bad as it was in Great Britain, owing to the very large quantities required for munitions for the Allies.

We then asked Mr. Wells if there were any indications of the American manufacturers devoting their attention to the medium-powered machine. The answer was in the negative; and he went on to say that there seemed to be a good prospect of the lightweight attaining a certain degree of popularity for use in districts where the roads were good, but that the medium-powered machine was simply non-existent. In his particular

case, the 5 h.p. model Indian, which has met with so great a success over here, is not sold at all in the United States. For the coming season 1,000 Indian two-strokes were laid down, but, owing to the demand being much greater than had been previously anticipated, provision had been made for the building of an additional 2,000. It is interesting to note that all the Indian two-strokes, for use both over here and in America, will be fitted with Amac carburettors. Altogether, the Hendee Co. hope to turn out 50,000 motor cycles this year, provided the necessary material can be delivered.

## Aluminium Pistons.

One of the materials in which there is certainly a great shortage is aluminium, but, fortunately, the Hendee Co. have a heavy stock to fall back upon. Mr. Wells then went on to make the interesting statement that he thought that the piston of the future would be made of die-stamped aluminium. Such pistons

were already used successfully on the twelve-cylinder Packard car. He also stated that carbon deposit does not adhere to the tops of these pistons to the same degree as on ordinary pistons. [Articles in *The Motor Cycle* have emphasised these points.—Ed.]

## Roads Improving.

We interrogated Mr. Wells concerning the condition of the roads in the United States. He assured us that the making of good roads was progressing by leaps and bounds, and the reason for this was that the necessity for well-kept highways had been forced upon the authorities by the enormous increase of the use of motor vehicles, with the result that many miles of Tarmac highways are now being laid down. The great Lincoln highway, which is to extend right across the continent, is rapidly approaching completion, and when this is finished it will indeed be worth travelling over.

# Recruiting Section.

R.F.C. Recruiting. Groups Over No. 13 Now Open for all Trades.

**F**OR two successive weeks we have dealt with the new scheme of the Royal Flying Corps in the matter of recruiting, and last week we were invited to inspect the lorries upon which are mounted the electrically-driven lathe, drill, grinder, etc., used for trade-testing the men who offer themselves for service.

A further change to be noted in the recruiting scheme is that attested men in groups over 13 may now offer themselves for all R.F.C. trades. Last week men in groups 6 to 9 were being examined

as to their special proficiency in various kinds of work.

Special recruiting parties to test the men are, we are informed, stationed at Woolwich, Chelsea, Leeds, Birmingham, Manchester, Edinburgh, and all necessary particulars may be obtained from local Recruiting Offices.

P. and M. motor bicycles are attached to each section, on which motor cyclists are invited to exhibit their riding abilities, and are afterwards tested in their knowledge of the mechanism. It is not sufficient to be a mere rider of a

motor bicycle, and know nothing whatever of its working.

The other trades which are open include fitters, car drivers, instrument repairers, coppersmiths, sail makers, and storemen with a knowledge of engine parts.

The pay in each case is 2s. per day. Should readers of any of the above named trades be unable to obtain particulars at their local Recruiting Offices, they may apply direct to Sec.-Lt. Goode, Officer in Charge, R.F.C. Party, Curzon Hall, Birmingham.

A MOTOR CYCLIST MISSIONARY IN THE JUNGLE.

The Rev. Rowling and his wife, who have toured extensively on their Douglas in Uganda, British East Africa, in the manner shown. Motor cyclist missionaries have very exciting times in B.E.A., but they are not regularly chased by lions and leopards as is popularly supposed!

## DON'T FORGET HOW TO STOP.

**I**T is always advisable, when riding a strange machine for the first time, to make sure exactly how the various levers work, and also that they do work. It is most important to know how to stop the machine quickly, if necessary, in an emergency. A member of our staff had a most exciting time recently when taking delivery of a second-hand two-cylinder two-stroke, the control of which was by throttle and half compression valve only. When trying the machine on the stand no difficulty was experienced in stopping the engine by shutting the throttle, the release valve only having

the effect of slightly reducing the power on this particular machine. However, upon making a running start the machine went off at a smart pace, and refused to be governed by the throttle at all. The road, which, fortunately, ran across a common, had several very sharp bends in it, the first having to be negotiated shortly after mounting. Shutting the throttle had no effect; the same result attended the lifting of the release valve. The speed was too great to attempt to negotiate the corner, so a somewhat bumpy ride over a portion of the common was the only alternative, a fall due to side-slip on the brink of a deep ditch eventually solving the problem of how to stop. After this experience a magneto cut-out was fitted.

## COMPETITIONS IN WAR TIME.

We notice that the old competition controversy is being revived. Every extra day the war lasts should render less likely the possibility of holding ordinary competitions, but an occasional event for service men might well be arranged in the summer.

## Britain's Petrol Supply.

A Doubtful Shortage. Opinions of Leading Suppliers.

**Q**UITE recently the Shell Petrol Co. announced that owing to a shortage in spirit some delay might ensue in the delivery of future supplies. This despite the fact that imports for 1915 constituted an easy record, totalling 144,939,700 gallons. We heralded the news as the first hint of an increase in price. We have made it our duty to enquire among some of the leading firms of petrol importers, and gather from them as a whole that there is an ample amount of spirit for present requirements. The increase of price is, they admit generally, due to the shortage of ships which deliver the spirit from the country of its origin to Great Britain and the increased freight charges. When questioned about the present cost, the representative of one firm mentioned to us that it was a considerable surprise to him that the price of petrol had not been put up earlier.

Anyhow, the position at present is this, that the price of petrol has increased, and certainly will not cost the unfortunate motorist any less in the future, while there is a very distinct prospect of its going up. Not, however, for some time to come, but eventually. At the present moment there certainly seems to be enough petrol in the country, but as the result of our enquiries we have been led to suppose that if things go on as they are it is just possible that there may be a shortage in the future. Below we give the views of some of the representatives of the principal firms of petrol importers in Great Britain.

**PRATT'S MOTOR SPIRIT SUPPLIES.**—In regard to the recently issued notice from the Shell Co. as to the possibility of a shortage of petrol, the Anglo-American Oil Co. say: "So far as we are concerned there is no shortage of spirit. We are taking care of very large

requirements for the Expeditionary Forces and the Admiralty, and, in addition, all the normal requirements of our commercial consumers and garage trade. It is much to be regretted that an unnecessary panicky statement as to the condition of the market should have been issued; it only has the tendency to bring about the very situation that should have been avoided. So far as this company is concerned, we are no parties to it."

**THE GAS LIGHTING IMPROVEMENT CO., LTD.,** Salisbury House, London Wall, E.C.—This company state that they have ample supplies of their three grades of motor spirit—Carburine, Carburine No. 2, and Glico motor spirit.

**CARLESS, CAPEL AND LEONARD,** Hackney Wick, N.E.—As far as this firm is concerned, there is enough petrol to supply the needs of its ordinary customers.

## A Paraffin Motor "Omnibus."

The Limit in Freak Machines.

**T**HE machine illustrated is the outcome of a commission given to a Mr. J. Forrest Walters, B.A., C.E., of Stanley Road, Teddington, to produce a vehicle for the rapid transport of large bodies of men with the utmost economy. If successful, the machine will, we are told, form part of the outfit of American railroad contractors.

The power unit is a two-cylinder water-cooled paraffin motor having four pistons, making it equivalent to four cylinders of 70 mm. bore x 80 mm. stroke. There are two crankshafts, which are coupled together by means of a rod having a right and left worm gear; this rod, also by worm gear, will drive the camshaft, magneto, and water cooling pumps. The drive is by belt to the front wheel, the rear wheel being the steerer. Both

wheels are sprung, and fitted with band brakes and 4in. section tyres.

A double frame will be used, and seating accommodation is provided for four

persons, while the wheelbase, we are told, is only twelve inches longer than that of the average present motor cycle, i.e., about 66in.

A quaint design for a four-seated motor cycle evolved by J. Forrest Walters.

## The Annual General Meeting of the M.C.C.

Possibility of the Opening Run to Brighton being held.

**C**ONSIDERING the abnormal circumstances obtaining at the present time the annual general meeting of the Motor Cycling Club which was held last week at the Café Monico, Piccadilly, was quite well attended. The chair was occupied by Mr. S. H. Fry, a founder member of the M.C.C. In consequence of the war the club remained comparatively inactive during last year. The report was read and adopted, and also the balance sheet, practically without discussion. It was then decided that the officers and committee of the club should be re-elected *en bloc*.

Mr. W. H. Wells suggested the continuing of the opening run, and it was finally decided that the advisability of holding this popular function should be left in the hands of the committee.

### Members on Active Service.

In the course of the proceedings Mr. R. H. Head, chairman of the Club Committee, mentioned that 149 members had been officially noted as having joined His Majesty's Forces, while it was known that a large number of others who could not be traced had also joined up, this probably meaning that at least 250 were serving either in the Navy or Army, which he considered to be a record for any motor cycling club. It was decided that the subscription should be 5s., as was the case last year. Mr. Head thanked the committee for the efficient attention they had given to the affairs of the club during a very trying time, and it was mentioned that of the committee Messrs. Karslake, Clark, Edwards, Southcombe May (honorary secretary), and Baddeley had joined the Forces.

During the absence of Mr. May the work of honorary treasurer and honorary secretary is being ably carried on by Mr. L. G. Funnell, for whose services a very hearty vote of thanks was passed. The proceedings terminated with a vote of thanks to the chairman.

### THE DARKENED STREETS.

The Home Secretary has stated that in view of the reduction of street lighting the Commissioner of Police has given special attention to the increased risks to pedestrians at congested crossings. The use of red or green lamps at dangerous crossings would lead to confusion without securing further safety, and a speed limit of 4 m.p.h. at such places could not be enforced owing to the difficulty of proof.

# MILITARY NOTES.

## DESPATCH RIDERS' EXPERIENCES IN MACEDONIA.

### VALUABLE EXPERIENCE GAINED ON ACTIVE SERVICE.

WE have received a letter from a staff-sergeant in a repair works belonging to the Royal Marine Artillery somewhere in France. He writes: "I am employed on mechanical transport work as a motor mechanic, and have been in France since February last. I was employed as mechanic in charge of the Midland Motor Co.'s workshops at Oxford before the war, and I can tell anyone engaged in the trade that Active Service teaches one more in a month than English roads teach in a lifetime. *The Motor Cycle* is obtainable every week in a town close by, so you will see we are not badly off!"

Among overseas letters last week was one from Sgt. A. J. Sproston, who, writing from Alexandria, Egypt, appears to be in the best of spirits.

The 3 h.p. Enfield reproduced on page 72 of our last issue belongs to M. Rouchy, a Belgian despatch rider, who is shown in the saddle. He speaks highly of the running of his machine under service conditions. It is one of a number of Enfields in the Belgian Army.

### THE SUPREME TEST. THE MOTOR CYCLE MAKES GOOD IN THE BALKANS.

THAT the motor cyclist despatch rider has proved capable of surmounting undreamed of difficulties in Serbia and Macedonia is borne out by a letter we have received from Despatch Rider T. G. Quinney. The letter makes such good and instructive reading that we reproduce it in full herewith:

"As a motor cyclist despatch rider it was with great interest I read references to the use of motor cycles in Macedonia in your issue of December 30th. I am in one of the divisions that effected the new landing at Suvla Bay (Gallipoli), and I can vouch for the fact

that we continually used motor cycles there after the first fortnight. We had a mixture of Triumphs and Douglasses, and used these for the rest of our stay and got complete satisfaction from them.

"From Suvla Bay we were taken to Salonica, and were the first division to land there. We took our machines with us, although they were fast falling into the 'old creak' stage as spares were at a premium. While we were in Salonica we got issued with new Douglasses, and shortly after this we moved up into Serbia. This is where the real test began, as the Serbian roads are hopeless. Nevertheless we still carried on. It was more like trick riding than motor cycling, as it was impossible to get a level road for more than a hundred yards. The so-called road would dip for several feet, and these hollows were full of rough cobbles. You can imagine what one felt like after a ride of twenty miles on a road like this. Everything that could shed itself came from the machines. The meagre stock of spares was soon exhausted, and we had to dismantle one good machine to get parts for the others. We used our motor cycles throughout the whole of the operations in this part and under all conditions.

"During the retreat from Serbia the machines came in for an especially trying time, as all wires were cut and despatch riding was the only means of communication. It was a great test, but the machines stood it remarkably well, and we finished up by riding along the railway track from Doiran to Salonica. This was the best ride we had.

"Now that we are back again in Salonica we are getting a rest, although there is still plenty of work to do. What with the D.R.'s of the other divisions, you can hardly go anywhere but you meet a Douglas or Triumph plodding along. I think all the D.R.'s in this part will agree with me when I say that no sort of weather makes any difference, and as long as there is a road or a mule track we get there. I wish *The Motor Cycle* every success."

### M.M.G.S. CASUALTIES.

IN a recent casualty list we notice the name of Lt. W. C. Strain, M.M.G.S., wounded, and among the list of officers in the Canadian contingent wounded, Capt. J. E. Browne, No. 1 Motor Machine Gun Battery.

### WITH THE CANADIAN M.M.G.S.

WITH so much attention focussed on the Motor Machine Gun Section, of which the editor of *The Motor Cycle* is recruiting officer, the existence of a similar section attached to the Canadian Expeditionary Force, now in France, is likely to be overlooked. Like their English comrades, the Canadians of the M.M.G.S. at present use their

Air mechanic H. E. Godfrey, R.N.A.S., who, as a member of the North Middlesex and North-West London clubs, took part in many competitions in the good days of the pre-war period.

machines but little for the work they are primarily intended. However, they are all ready for the great offensive, and meanwhile the following note from a member of the brigade, Pte. J. Aldersley, is of interest:

"We do not use the sidecar machines at present, except for carrying ammunition. It has all been trench work so far. Our outfits are similar to those of the British M.M.G.S. The solo machines were originally all Douglasses, but, of course, some of them have been broken up or smashed; in fact, mine is the last Douglas of the original set left, and by the time you receive this I shall be mounted on a Triumph.

"I must certainly speak well of the Douglas, as I had mine for eight months. The latter included a couple of trips to the hospital, through skids on these cobble stones which are most treacherous in wet weather. My Douglas has done a great deal of towing of other machines which have been stopped on the road. One day I was out teaching one of the boys to ride when his machine broke down fourteen miles from camp. I put a rope round his front forks and tied the other end to my stand. It was a very dark night, and as my companion was a novice it was a trying ride. Anyway, we set off, and I just impressed upon him to keep the rope tight by using his foot brake. We never left our seats once until we arrived back in camp. I did not use the high gear very many times, but I call it a very remarkable performance."

Sidecar ambulance used by the French military authorities. Ambulances, machine guns, rapid transit of officers—what will be the next sphere of the sidecar?

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

### The Case of Disabled Motor Cyclists.

Sir,—We read with pleasure that you are interesting yourselves in a scheme for finding employment for discharged Army and Navy men who have had some little knowledge or experience in motor work. There is no doubt that good jobs can be found for such men if they are not totally disabled. Even if at the present time there were not so much need, it is well that we should be organised and ready.

Just recently we have ourselves set on in our works a partially disabled soldier as a works policeman. We expect that his Army training and his previous experience will fit him specially for a job of this sort; this man was found for us by the Rotary Club in Birmingham, who have undertaken to provide work for men much in the same way as the scheme you have in hand. We should be pleased to notify you as to what vacancies we have or could make, and we have no doubt that other motor cycle manufacturers will also be glad to bear this in mind, and notify committees in various centres when there is an opening.

Wishing good luck to the movement,

BUTTERFIELDS, LTD.

### The Isle of Man.

Sir,—In your issue for January 27th you do the Isle of Man Steam Packet Co. but scanty justice. You mention that two of their boats are doing War Service. This company has (or had) a magnificent fleet of seventeen of the finest passenger boats in the British Isles, including the fastest passenger boat in the world—the *Ben-ma-Chree*. Of this fleet fifteen are now in H.M. Navy. One is a long-distance transport, six are short-distance transports, and the rest are patrolling different parts of the world. The *Ramsey*, which must be well-known to all T.T. enthusiasts, has already paid the penalty of her excessive pluck.

Cannot some of your readers come over here for a motor cycling trip to this motor cyclists' paradise and help the people of this much stricken island to live? Just now, with no T.T. races, no car races, and no excursions: our poor boarding-house keepers and tradespeople are in sore straits. We offer you magnificent scenery, splendid roads, first-rate accommodation, and a most hearty welcome. Sulby Bridge, Ramsey hairpin, the Goose Neck, the mountain road, Bray Hill, Ballacraigne, and Creg Willy Hill, with their lovely backgrounds of bold mountain and wild glen, and round them all the wide sea—all these places famous in the annals of motor cycling—are offering the amateur such charms and exhilaration as he can find nowhere else in the British Isles—and we have no speed limit.

Castletown, I.O.M.

(REV.) E. H. STENNING.

### Two-stroke Design.

Sir,—I notice in *The Motor Cycle* of January 20th an article written by Mr. James Martin on two-stroke engines, in which he points out that the chief faults of this type of engine are lack of flexibility, four-stroking, and heavy fuel consumption.

I have invented a carburettor which gives a two-stroke the same flexibility as a four-stroke, and I should be pleased if Mr. Martin could test this invention. P.W.H.

Sir,—We agree with a good deal of what Mr. Martin says, but would point out that his essential idea—that of conserving the released gases—is embodied in Murphy's patent and used in our  $\frac{3}{2}$  h.p. Bullet two-stroke. In its

simpler form it consists of a release valve communicating (by means of a small diameter brass tube down which the flame of combustion cannot pass) with the transfer chamber.

With this arrangement you can drive to a large extent on the release valve, but we scarcely think that, even with a mechanically-operated valve such as he proposes, the throttle could be discarded altogether.

The reduced pressure in the cylinder does indeed give very cool running. The comparative freedom from exhaust gases in the new charge may also help, but their supposed deleterious effect is a point Mr. Martin can emphasise too much. A reasonable proportion of inert gases (we are speaking now of the gases themselves without reference to their temperature) can surely do little harm; if so we should be having trouble with the nitrogen of the air, which is absurd.

BIRMINGHAM LIGHT MACHINE CO.

H. R. HUGHES.

Sir,—Will you please allow me to state how much I appreciate Mr. James Martin's article on the two-stroke motor cycle engine in the last issue of *The Motor Cycle*. It is well thought out, and most instructive to amateurs like myself who are greatly interested in all that appertains to motor cycles. But I do take exception to what he points out as the three great faults of all two-stroke engines.

I have had three Scott motor cycles, viz., 1910, 1912, and 1914, and have ridden close on 30,000 miles, but I have never been in traffic where I could not keep behind and still keep my engine running, which does not tally with Mr. Martin's statement *re* coarseness and want of flexibility. I have never had the slightest sign of four-stroke, and as to petrol consumption, I never run less than 65 m.p.g. with sidecar and passenger, and the engine is always clean, both inside and on the surface. I have never had a drop of oil from the engine on either boots or clothing, and have travelled as much as 7,000 miles without a single stop from mechanical trouble on the road. Could any motor cyclist wish for more?

T. J. BELLINGHAM.

Sir,—We read with feelings of mixed interest the article on "A New Design of Two-stroke Engine," by Mr. J. Martin, appearing in your issue of January 20th. The author puts the faults or shortcomings of the two-stroke engine in a very fair and clear manner, but we feel that he tries to belittle the advantages of this kind of engine. For instance, he speaks of the heavy consumption of oil and fuel on the standard type of engine of about 70 m.m. bore.

We feel that as far as the Connaught engine is concerned he can know very little of what this engine can do. We are prepared to show dozens of letters from various riders whom we have never met who are getting from 100 to 160 m.p.g., and, as far as oil consumption is concerned, we are quite sure that in proportion to the power of four-stroke engines the Connaught engine can show at least 25% advantage. Mr. Martin makes an assertion that the general design has not altered "one iota" for some years. This in our case is distinctly untrue, as we in 1912 placed on the market an engine differing greatly in design from the standard two-stroke engine, which was invented about 1880 or 1883 by Mr. Day and has been blindly copied since then. Since its first appearance we claim to have improved details of our engine in very many ways.

What we are mostly concerned about, however, is the so-called new design illustrated in the article referred to.

We wish to state that we took out a provisional protection some months ago for the identical engine, and a complete specification and drawings are now in course of preparation. If we did not know it to be impossible, we might have said that Mr. Martin had seen our designs, his engine being an exact copy of ours.

We presume when he speaks of the "large firms" that he would not be thinking of ourselves, but in our own defence we wish to say that we have never ceased to spend time and money in experiments and research in order to maintain the position we have made for ourselves. We have only to say that we were the first firm to publish details of a simple horizontally opposed twin two-stroke engine, which was the signal for others to follow.

The great vogue of the two-stroke engine is due to its simplicity of construction, and users feel that that simplicity and efficiency amply repay them for any trifling shortcomings which it may have as compared with the complications of the four-stroke engines.

THE BORDESLEY ENGINEERING CO., LTD.

#### Wanted, a Motor Tricycle.

Sir,—May I strongly urge your correspondent Mr. R. Aitchison to abandon all idea of purchasing anything on the lines of a tricycle, and to go in for a sidecar outfit instead. The fact that the tricycle is finally superseded by the sidecar points to the practical superiority of the latter. I would advise your correspondent to go in for a  $3\frac{1}{2}$  h.p. chain-driven single-cylinder machine fitted with a kick starter, such as a P. and M., Bradbury, or Sunbeam. If the question of price is of importance he might safely venture so far back as a 1912 model, so long as proper judgment is exercised in its purchase, and having made his purchase I would advise him to ascertain the top gear ratio, and, if necessary, reduce it to, say,  $5\frac{1}{2}$  to 1. He will find the sidecar will prevent side-slip, while it will prove immensely useful for carrying such personal items as a spare waterproof or papers in connection with his business.

The reason why I recommend a  $3\frac{1}{2}$  h.p. machine in preference to a lightweight is because there is not the same likelihood of konking out on hills and having to push—a procedure which would be regrettable for a rider of your correspondent's advanced years. Also, he will find a powerful machine less tiring to handle than one of small c.c. Again, if a lightweight of, say,  $2\frac{1}{2}$  h.p. were used a very light sidecar would be necessary, and light sidecars are dangerous for any but active riders, when ridden empty, owing to the suddenness with which they lift on corners.

If your correspondent would care to write me personally I shall be happy to advise him to the best of my ability.

H. M. B.

#### Spring Frame Design.

Sir,—We are interested readers of your paper, and have noticed in the issue dated January 13th a spring frame design evolved by Mr. P. Mills. This spring has already been used on the landing chassis of the Blériot monoplane. We have attempted to utilise this device on our lightweight motor cycles. We find that it is inadequate. Perhaps the "inventor," Mr. P. Mills, could correspond and explain the difficulty.

GERARD SIMPSON.  
REGINALD LISTON.

#### Repairing Inner Tubes.

Sir,—There has been a considerable amount of correspondence in your columns about the various methods of repairing inner tubes, but none of them appear to be equal to the Diamond tyre patches which I purchased in America.

These patches have the business side protected by a thin piece of canvas. When repairing a punctured tube it is only necessary to remove the canvas, which tears off easily, and to saturate the prepared face of the patch with petrol. After the petrol is drained off and the patch exposed to the air it reaches in a few minutes the correct degree of tackiness, and should be applied to the tube, which has previously been cleaned in the usual manner. No rubber solution or other adhesive is to be used.

I have used these patches on Ford car tubes and on motor cycle tubes for the last two years, and have not yet had one leak or lift or otherwise give trouble. The manufacturers, I believe, are the Diamond Tyre Co., an American concern, and I do not know whether the patches can be obtained in England.

C. G. BIRCH.

#### A New Breed of Cycle Car.

Sir,—As I am a constant reader of your paper I noticed a reference made in the issue of November 25th by "Ixion" to a small car that was used by an American aviator, the design of which your correspondent took occasion to commend. On account of my familiarity with the car in question, I take pleasure in sending you a photograph of it. The man seated in the miniature automobile is Art. Smith, the official aviator of the recent Panama-Pacific International Exposition. Besides being a most fearless and skilful airman, Mr. Smith is the designer of the machine illustrated.

The car is of the double chain-drive type with a differential on the countershaft. The motor is a 11 h.p. twin-cylinder racing Harley-Davidson, with three-speed gear box and clutch of the same make, all mounted in the same way as in the Harley-Davidson motor cycle, but to the left of the driver, and under the bonnet in front, a position that permits the operator to obtain plenty of leg room. The engine is started after the driver is seated by a kick-starter that is conveniently located. About one gallon of oil is carried in

a compartment in the dummy radiator, and the petrol tank (holding three gallons) is located behind the driver's seat.

The wheels are of the regular 20in. x 4in. aeroplane type, as used on nearly all American aeroplanes. Goodyear tyres are fitted, and a spare wheel will be observed carried in regular tyre holders at the extreme rear of the machine.

Half-elliptic springs are in front and cantilever springs at the back, with about 2in. spring amplitude. Thanks to the large diameter of the tyres, the little car rides remarkably easily. It is electrically lighted, the current being furnished by a storage battery.

Art. Smith has placed an order with Maggini and Perkins, the San Francisco Harley-Davidson agents, for ten more power plants of similar design, his intention being to build ten more miniature cars of similar make to the one illustrated. Speed will be the main object, as Smith's plans are to organise races for these little machines in conjunction with his aeroplane displays.

WILLIAM E. SLATER.

San Francisco, Cal.

The newest breed of cycle car. An American twin-cylinder of most attractive specification and appearance owned by a famous American aviator. It is described in the letter from Mr. Slater on this page.

**Foreign Magnetos.**

Sir,—I notice in "Ixion's" comments in a recent issue of your excellent paper that he complains of trouble with American magnetos. Two friends and I have had machines fitted with American magnetos, and we have all had a great deal of trouble since we had the machines. They have all given up the ghost completely, like "Ixion's," after 2,000 miles. After I have spent a day overhauling them, they go about another 2,000 miles, and sometimes less. We have decided that on our next machines we will have British magnetos.

C. BESWICK.

**Sparking Plug Design.**

Sir,—The so-called "Novel Sparking Plug" illustrated on page 49 of *The Motor Cycle* for January 20th has a striking likeness to the sparking plug patented to us on patent No. 19,800, 1911, the specification of which we enclose for your perusal. You will see that one of the electrodes has a hollow conical form, and acts when in use as a venturi tube exactly as is claimed for the plug illustrating your review.

In fairness to us we hope you will see your way clear to refer to this matter in your next issue, so as to draw the attention of your readers to the fact that the conical form of the cup constitutes a prominent feature of the Forward patented sparking plug.

THE FORWARD MOTOR CO.

[The specification enclosed shows designs of plugs with ring and conical cup electrodes, but in justice to Mr. Burton we must remark that no mention is made of a venturi tube action.—Ed.]

**A Death Trap.**

Sir,—I was riding my motor cycle, with a friend on the carrier, recently between Formby and Prescott. It was at night, and my lamp, now that the new Lighting Order is in force, gives only a feeble light.

The road on nearing Maghull passes over the Leeds and Liverpool Canal by means of a swing bridge operated by hand. There was not a red lamp or, indeed, a lamp of any sort guarding the approach to the bridge, and I stopped dead a bare three yards from the water's edge as the bridge swung back to the other side to allow four or five steam barges to pass.

It was only the lights on the barges which caused me to pull up in time. On enquiry I was told that all bridges on this canal are left similarly unguarded (although I cannot vouch for this statement), and can only wonder whether any vehicles have gone into the canal through the absence of warning. Surely it is somebody's duty to see that lights are put in such places, especially at this time of darkened roads.

W. I. S. KELWAY.

[We have no doubt that one of the motoring bodies will take action in the matter now that the complaint has been ventilated.—Ed.]

**Four-cylinder Motor Cycles.**

Sir,—I read with interest the articles in *The Motor Cycle* of January 13th on the subject of four-cylinder machines. Perhaps my experiences with some of the older types might interest you and your readers.

My first two motor cycles were up to date belt-driven singles, and I can honestly say that I never had a full week's running without some mechanical trouble or other. I bought my first four-cylinder F.N. a year and a half ago. It was a 1908 model, and I fully expected plenty of trouble. I certainly had my share of it for about a fortnight until I got to understand matters, and from then until the day I sold it (about five months ago) I never had a mechanical stop or even a puncture. I nearly always had a passenger on the carrier, and only hills like "Rest and be Thankful" used to make us dismount.

When I bought it the carburetter fitted was a B. and B., which perhaps gave a little extra power when running,

but the engine never went well until I tried the F.N. automatic carburetter, when all misfiring when the throttle was opened came to an end, and much slower running was obtained—in fact, I could go at 5 m.p.h. without a misfire or a jar of any kind occurring. Central intakes were also fitted.

I am at present riding another 1908 four-cylinder F.N. with greater success than the first one. The machine will not run so slowly owing to the strength of the automatic valve springs, but this will gradually wear off, and the highest speed I have got so far is 53 m.p.h., without any preparation.

Skidding is a thing I have never experienced with an F.N., even on the worst kinds of roads, and in the city here (Glasgow). I have yet to have that terrible trouble with the inlet valves and magneto which I get dinned into me by people who have never ridden a four-cylinder F.N. in their lives, but have heard about it from so and so.

I think if one uses his machine decently, taking a little time now and again to go over it he will not find a more trusty machine than the four-cylinder shaft-driven F.N. I will never use another make of machine if I can get an F.N.

I add the usual disclaimer.

WM. O. HARVIE.

**The Motor Cycle Thief.**

Sir,—On behalf of the motor cycling world, I should be glad if you would let this letter act as a warning to owners selling their machines. I advertised my 1915 7-9 h.p. American Excelsior for sale recently, and a man of about 26 years of age, clean shaven, thin face (somewhat lined), medium height, and wearing a slouch hat, muffler, and light overcoat, applied to see the machine. Having shown it to him he fixed on a certain price, he agreeing to call in the morning, pay for, and take away the cycle. But as soon as my back was turned he slipped back to where I store the machine and decamped with it. This was in the evening of the 17th ult. He could not have ridden it, as it was not in working order. He must, therefore, have wheeled it to his destination.

The machine is one of the earlier 1915 7-9 h.p. models, fitted with the single gear, colour grey, which he will probably alter. I am prepared to offer a sum of £5 for information which may lead to its recovery.

JOHN W. SHARPUS.

24a, Earl's Court Gardens, S.W.

**A Home-made Hood and Windscreen.**

Sir,—I am enclosing two photographs showing a hood and windscreen entirely made at home. There are no strap attachments, and the whole can be put up or down by the passenger without any assistance, in any kind of weather, while the machine is in motion. The sidecar is entirely covered in right up to the passenger with three-ply wood, to which the windscreen is attached. When not in use, it folds back flat on to the cover, and the wings fold inwards flat on to the screen. This is the second winter I have ridden with this attachment.

The combination is a 6 h.p. Matchless and Coronet sidecar.

W. TOLSON.

Home-made hood and screen described in letter on this page from Mr. W. Tolson.

## ROYAL RUBY SPRING FRAME.

Important Addition to the List of Firms producing Spring Frame Motor Cycles.

**A** VERY interesting spring frame machine, which we have recently tried, is the latest production of the Royal Ruby Cycle Co., Ancoats, Manchester. The system of springing Messrs. Royal Ruby have

for the sidecar axle coupling. A special sidecar, sprung on the same lines as the machine, is now under course of construction.

The carrier seat stays and rear mud-guard can be detached from the machine as one unit, and their removal in no way interferes with the rigidity of the frame.

being similar to that of the Druid, except that long leaf springs, with their unequalled shock-absorbing qualities, take the place of the ordinary coil springs. The action of these forks is fascinating to watch, and even under the most severe conditions no road jolt is conveyed to the handle-bars.

The model is provided with a metal-to-metal internal expanding foot brake and foot controls for the clutch, and a Jardine four-speed gear is fitted. The position of the footboards can be adjusted to suit the rider by simply loosening one nut. Both wheels are of the quick detachable variety, and many other minor points of convenience are incorporated in this luxurious model twin-cylinder sidecar mount.

Twin-cylinder chain-cum-belt driven Royal Ruby fitted with the manufacturers' spring frame described on this page. In the upper view the carrier and rear guard are removed to illustrate more clearly the system of suspension.

employed is thoroughly sound, but it may be mentioned that the makers do not, as yet, consider the device has attained their usual high standard of excellence, and only after long and severe road test will they rest assured that the model is ready for the hands of their purchasers.

The machine, which is fitted with an 8 h.p. J.A.P. engine, and designed throughout for sidecar use, is sprung both front and rear by means of long leaf springs, pivoted at the wheel axles, so that an absolute minimum of unsprung weight is obtained. With regard to the rear springing, it will be observed that the only unsprung portions of the frame are the chain stays, which perform the important function of holding the wheel in position and preventing lateral movement. With the exception of these stays, the entire frame, including the carrier, etc., is insulated from road shock, the machine thereby gliding over the worst of roads with no suggestion of jolt.

On the left-hand side of the rear wheel a stout pipe is extended parallel with the chain stay, and at the end of this tube a vertical guide, passing through a bearing carried by the chain stay, gives additional support. This bar is, of course, sprung with the remainder of the frame, and to it is brazed the attachment

The chain stays are very strongly constructed, and ample bearing surfaces are provided for all working parts.

The springing of the front wheel is at once obvious, the action of the forks

A near view of the Royal Ruby method of springing the back wheel.

### MEMBERS OF THE PUBLIC SCHOOLS M.C.C. AT THE FRONT.

In a recent issue we published the names of several P.S.M.C.C. men who were serving their country in various parts of the world. We have lately received a letter from Cpl. H. B. Brown, from which we make the following extracts:

"Bertram Fowke came out with me. He is now with the 5th Division. I have not seen him since we left the base. I came across Victor Dreshfield and Jack Pauling in September, who are in a machine gun section of the 6th Buffs. They were in the fighting at the end of September, but were both fit and well when I last saw them. Tamplin is a sergeant in the R.E.'s, and is employed on special work in an English factory. I am myself riding a 1915 Triumph. North, of Ariels, is with us now."

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### High Compression.

**?** Will you please tell me the reason I have to time my engine—an old a.i.v. twin—so late to get the best results? The points break with piston on top, lever fully advanced.—G.H.

It is curious that you should have to time your engine so late. Perhaps the reason is that your connecting rod bearings are rather worn, so causing the engine to knock if the ignition is advanced too far. The only other reason would be that the compression is too high; therefore the best result is obtained by igniting the mixture after the compression is slightly lower, due to the piston having passed the dead centre. If this be the case, it would be advisable to lower it slightly by inserting a washer between the cylinder and crank case.

### The Breakage of Petrol Pipes.

**?** Could you tell me a better method of conveying lubricating oil and petrol than by copper tubes? The latter, it seems, are given to breaking, for while starting the engine a short time ago the oil, which is force fed, escaped and ran on to the ground. When it was examined the pipe was seen to be broken just below one of the unions. This is not the first time this has happened, therefore I think there should be some better and more flexible tubing on the market. Some time ago I think I saw some tubing that would satisfy my wants in use on a racing machine, and this I believe was made out of very thin strands of leather woven together.—R.F.R.

There is no better way of conveying petrol and lubricating oil than by copper pipes. The cause of the latter breaking is probably due to the fact that they are not properly annealed (which should be done by heating them to a red heat and then cooling them by immersion in water), or that the pipe is too short. The pipe should have curves in it, so as to allow sufficient spring to avoid being broken through vibration. There is a flexible tubing for petrol, which is sold by Messrs. Bowden Wire, Ltd., Victoria Road, Willesden Junction, N.W., but copper is more generally used, though on aeroplane engines an armoured petrol-proof rubber pipe is employed.

### Oil Leakage.

**?** I shall be much obliged if you will kindly give me advice with reference to the following matters relating to my  $2\frac{1}{2}$  h.p. 1914 motor cycle: Oil is thrown out round the tappets, and between the pulley and crank case. I have fitted brown paper washers at the crank case joint and between the timing cover and base, but do not know the best way to cure the other leaks. Should a vacuum valve be fitted, and if so, does it matter whether fitted to the crank case or the timing case (the latter would be more accessible)? If such a valve is necessary, will you please say upon what principle it is designed to work?—L.G.B.

The fitting of a felt washer between the pulley and crank case is sometimes beneficial. The leakage of oil round the tappets may be due to worn tappet guides. The vacuum valve is certainly advantageous, and as it reduces pressure in the crank case, it naturally prevents the leakage of oil, provided, of course, that the bearings are in good order. The valve is merely a non-return valve; usually of the ball type. When the piston descends the ball is blown off the seating, and allows the crank case compression to escape. On the up stroke the valve closes. Provided there is a good connection between the crank case and the timing gear case, you may fit the relief valve on the timing gear case; otherwise, on any convenient spot in the crank case.

### Finding Gear Ratios.

**?** (1.) I have a 1913 4 h.p., clutch in back wheel. The top gear is about  $3\frac{1}{2}$  to 1. The back belt rim is 20in. I wish to reduce the gear to about 5 to 1 top for sidecar work. What would the gears be respectively with a 22in. and 23in. back belt rim? (2.) What is the best oil to use for a plate clutch? (3.) My valve caps leak. I have fitted new washers, but there is still a faint leak around them. What can I do?—R.B.

(1.) You do not furnish sufficient particulars for us to give you the exact gears you will obtain with various sized belt rims, as you do not say what size your pulley is, and also from what point you

are measuring the belt rims. We assume you have a 1in. belt, and will take the measurements from the point in the pulley where the centre of the belt is when placed in position. The front pulley is 5in. in diameter and the present rear belt rim is 19in. when measured in this manner, therefore the two belt rims will give  $4\frac{1}{2}$  to 1 and  $4\frac{3}{4}$  to 1 respectively. It is a simple calculation to ascertain the gears obtained with various pulleys. Take the diameters of the engine pulley and belt rim from the points where the centre of the belt is and divide the smaller into the larger; this will give you the gear you will obtain. (2.) Thin engine oil, or engine oil mixed with a little paraffin is most suitable for a metal-to-metal plate clutch. If the clutch is too fierce add more oil; if inclined to slip add more paraffin. (3.) If you have fitted new copper washers and tightened the caps down as much as possible when the engine is warm you should not have leaks. If, however, it still leaks after doing this, remove the cap, and apply a little engine oil or black lead to the thread of the cap, and also on both sides of the washer.

### Turning a Sidecar.

**?** Does either the sidecar wheel or back wheel of a motor bicycle with sidecar skid sideways in any appreciable manner when the machine is turning in the direction to which the sidecar is attached? For instance, place a machine with sidecar on a perfectly flat surface; put the steering wheel (front wheel of bicycle) in any position. Can the machine be moved in a circular path without any of the wheels having to skid sideways?—J.H.

You can turn to your left practically in your own length, as the sidecar wheel merely acts as a pivot, and remains almost stationary, while the motor cycle back wheel does the driving. In turning to the right, however, there would be a slight amount of skidding, as the motor bicycle wheel would have to drive and act as a pivot at the same time. It is better, when you have to turn sharply, to turn to the left when you are driving a sidecar combination. Care, however, should be taken, when turning in this direction, as the sidecar wheel is very liable to lift.

**SPECIAL NOTICE.**—Copies of "The Motor Cycle" may only be sent to neutral European countries if posted direct from the offices of the publishers, or by agents who have obtained permission from the War Office for this purpose. The publishers of "The Motor Cycle" have obtained the necessary permission, and, consequently, can send subscribers' copies as usual. Before sending through newspapers it is important to enquire if permission has been obtained, as otherwise copies intended for neutral European countries will not be forwarded by the Post Office.

**Popping in Carburetter.**

?

I ride a Junior Triumph, 1915. When I start I flood the carburetter and push off as per directions. Then the carburetter gives a big flash and explosion—I suppose a backfire. I then start again, when it may recur or go on well. This backfire into the carburetter sometimes occurs when I am riding. I then stop and go off again. I notice after a backfire the engine never runs as well as when it does not occur.—W.D.

The cause of popping back into the carburetter is usually due to too weak a mixture. It may be caused by a partially choked jet or too liberal a supply of air. Excessive carbonisation, causing pre-ignition, might also cause this trouble on a two-stroke, but this would only be noticed after running some distance.

**Lubrication of Magneto.**

?

I own a 2½ h.p. two-stroke motor cycle, which I have ridden during the past twelve months, and I think it is about time the magneto was oiled. The magneto is a small U.H., but the trouble is that I cannot see any oil holes, and it has been making a grinding noise lately. I shall be very glad if you can help me out of my difficulty with it.—H.H.

If no lubricators are provided on your magneto, the bearings are lubricated by being packed with grease, which should be sufficient for a very considerable time, probably 5,000 miles. To repack them it is necessary to take the magneto down and remove the end plates; the bearings should then be well packed with vaseline. The grinding noise may be due to a broken ball cage or even a broken ball, so it would be advisable to take the bearings down in any case. As you are a novice we would advise you to consult an electrician.

**Cleaning by the Oxygen Process.**

?

My machine is a 6 h.p. horizontally opposed water-cooled Humber of 1916 make. Is it at all harmful to clean the cylinders by burning out the carbon deposit by oxygen gas as is done in the case of car engines? There seems to be a divided opinion as to the result of this on the metal. Do you know whether any harm is caused to the cylinder walls or the piston? I might say the valves and the valve seatings in this model are removable without taking off the cylinder, therefore before the gas was used the valves could be removed with their seatings.—R.J.A.

There is no harm in the oxygen process for cleaning cylinders. We have had a Douglas motor bicycle cleaned out in this way, and the result was most satisfactory. This does not mean that the process can entirely take the place of taking down the engine, which should be done at least once a year. The oxygen process relieves the cylinder heads, pistons, valves, etc., of carbon, but, of course, does not get at the carbon behind the rings. It would certainly be as well to remove the valves and seatings.

**READER'S REPLY.****Too High a Gear.**

I notice in your issue of January 20th (page 61) a letter from "M.R.S." regarding trouble with a 1915 5 h.p. Indian. I possess a similar machine, and as I had similar trouble, perhaps my remedy may be of use to him. The engine sprocket wheel on this machine has usually eighteen cogs. Write to Hendee Co. (give No. of engine) and get a fourteen-tooth sprocket wheel which costs about 4s. Remove one link from engine chain when fitting. This smaller wheel will enable him to crawl at twelve miles per hour on middle, and about fifteen to seventeen on top gear. I am afraid there is something wrong with his mechanical lubricator. I can get ninety-five to one hundred and five miles per quart. The Hendee Co. issue a book of instructions (gratis), which gives very useful information.—M.R. McC.

**EXPERIENCES WANTED.**

"J.M." (Dublin).—Grado multi-pulley on a 3½ h.p. solo. Belt wear and slipping.

"A.S.R." (Caithness).—Zilla, Whittle, or Service No. 3 belts, with heavy chain-cum-belt combination.

"F.L.H." (Solihull).—2½ h.p. 1913 Humber twin, and 1915 2½ h.p. Ixion and O.K. two-strokes.

"H.R.N." (Grantham).—F.N. (four-cylinder) 1913-14. Reliability, speed, efficiency, consumption, ease of starting, and smoothness of shaft drive.

"B.F.R." (Birmingham).—2½ h.p. de luxe T.D.C. Reliability and capability for sidecar work. Also Grado pulley.

**RECOMMENDED ROUTES.**

HAWKHURST TO WOOLWICH.—C.J.S.

Hawkhurst, Lamberhurst, Pembury, Tonbridge, Sevenoaks, Locks Bottom, Bickley, Elmstead Woods, Mottingham, Eltham, Well Hall station, Woolwich.

READING TO EASTBOURNE.—A.C.

Reading, Odiham, Farnham, Guildford, Cranleigh, Horsham, Cowfold, Hurstpierpoint, Ditchling, Lewes, Wilmington, Eastbourne. Approximately eighty miles.

NEWPORT (MON.) TO PAISLEY.—W.D.E.

Newport, Monmouth, Hereford, Leominster, Ludlow, Craven Arms, Church Stretton, Shrewsbury, Whitchurch, Tarporley, Warrington, Wigan, Preston, Garstang, Lancaster, Kendal, Penrith, Carlisle, Gretna Green, Ecclefechan, Lockerbie, Beattock, Abington Inn, Stonehouse, Strathaven, Kilbride, Paisley.

BIRMINGHAM TO EASTBOURNE.—B.W.H.

Birmingham, Stonebridge, Coventry, Ryton, Dunchurch, Braunston, Daventry, Weedon, Towcester, Stony Stratford, Fenny Stratford, Dunstable, Redhourn, St. Albans, Hatfield, Hertingfordbury, Hoddeston, Waltham Cross, Wake Arms, Epping, Chipping Ongar, Brentwood, Ingrave, Orsett, Tilbury, ferry, across Thames to Gravesend, Meopham, Wrotham, Ightham, Tonbridge, Tunbridge Wells, Mayfield, Cross-in-Hand, Hailsham, Eastbourne. Approximately 200 miles.

**INITIATION INTO THE PLEASURES OF SIDECARING.**

Father Adderly, the well-known Birmingham canon, off for his first run in a sidecar, which he thoroughly enjoyed. The driver of the Sunbeam-Canoet sidecar outfit is T. Blyth Clayton, a Midland photographic contributor to this journal.

# DUNHILLS

## PATENT

# TRIPLE WINDSCREEN.

**A**N ideal windscreen—keeps the passenger always snug and cosy in the coldest weather and free from draughts.

The side wings are detachable, and the screen can be tilted to any angle. It will fit any make of car.

A twist of a wing nut is sufficient to release the catch and let the screen swing across and allow the passenger to alight.

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd., and crossed** & Co.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## MOTOR CYCLES FOR SALE.

### Abingdon.

**L**ATE 1914 Abingdon King Dick, clutch, kick start, in perfect condition, good tyres and belt, too fast and powerful for owner; £40, lowest; also Villiers free engine wheel, complete with control, not run 100 miles, £27/5.—Toms, Tremcor, Withiel, Bodinn, Cornwall. [X0752]

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

## Those Springs

—the Springs of the famous DRUID MARK II.—mean all the difference between a complete and part Efficiency—between your complete comfort and satisfaction and partial comfort and dissatisfaction.

Bear well that fact in mind, and, whether 1916 will find you riding new machine or old, see to it that the Fork fitted is the

## DRUID MARK II

—the ONLY Spring Fork which embodies the CORRECT "Design-principle"—the ONLY Fork which totally absorbs WITHIN ITSELF every kind of shock both Vertical and Horizontal, and the ONLY Fork which will ensure your continuous comfort under all road conditions.

Ask your Agent about the DRUID—or write the makers direct for full particulars.

A. DREW & CO., LTD.,  
Leopold Street,  
BIRMINGHAM.

**ZENITH-GRADUA** Combination, 8 h.p., new tyres front and back; £47; any trial any time.—16, Longmead Rd., Tooting, S.W. [X9321]

**ZENITH** 4 h.p. Twin, Gradua gear, not run 200 miles, with accessories; just cost £63, sell £52.—Tilley, The Esplanade, Weymouth. [X0993]

**ZENITH 1914** Twin, new condition, 6 h.p., Millford sidecar, speedometer, horn, lamps, etc.; £55; no exchange.—Edis, 178, Garratt Lane, Earlsfield. [X9236]

**8 h.p. Zenith-Gradua**, 1915½, with F.R.S. lamp, speedometer, and Lucas horn, and Bramble sidecar; 1,500 miles; £72.—To be seen at Stretton's Garage, Gloucester. [X0835]

**ZENITH** Twin, 6 h.p., 1913, splendid condition, with new Bramble coachbuilt sidecar; cost £12, cheap, £48, with lamp, etc.—Smith, Grocer, Somersham. [X0715]

**1914 8 h.p. Zenith**, clutch model, kick starter, splendid order; any trial given, distance no object; large Lucas lamp and horn, electric rear light, good tyres and belt; approval on "The Motor Cycle" deposit system; best offer over £45.—29, Green St., Cambridge. [X0784]

**ZENITHS**, new 1916 models, for immediate delivery from stock; 6 h.p. models, countershaft gear, and free engine and kick start, £84/6/3; 4-5 h.p. twins, popular solo mounts, kick start, free engine, countershaft gear, £75/18; guaranteed.—Wanchope's, 9, Shoe Lane, Fleet St., London. [X0898]

## Ladies' Machines.

**CONSULT** Rex Mundy before purchasing a new or second-hand ladies' machines.—See "Consulting Engineers" column. [X9518]

**SINGER**, lady's model, 2½ h.p., free engine, speedometer, new tyres and belt, perfect running order; £30.—Barford, Brinton, Somerset. [X9245]

**LADY'S** Lewis, 2-stroke, free engine and kick start model, 1914 machine, in nice condition; £22/10; guaranteed.—Wanchope's, 9, Shoe Lane, London. [X0895]

**NEW** Imperial, lady's, 2-speed, kick start, handle-bar clutch; first cheque secures one of these splendid lady's mounts; 43 gns.—Local Agents, Embro Cycle and Motor Co., Charlotte St., Hull. [X9242]

**LADY'S** Douglas, 1913-14, 2-speed, clutch, kick starter, lamps, horn, spares, Wilkinson carburettor, giving great range of speeds, very little used, exceptionally fine engine, selected for lady trials rider, great on hills; any trial; price £40.—S., 41, Ash Rd., Stratford, E. [X9300]

## Miscellaneous.

**1916 Big Four** Combination, chain drive and T.T. models in stock.—Wilkin, Hunter's Bar, Sheffield. [X9450]

**If You Want Bargains** in second-hand motor cycles you can get them at Wanchope's, 9, Shoe Lane, Fleet St., London. [X6624]

**SMART** Combination, 1914, 3½ h.p., 3-speed, cane sidecar, well upholstered, lamp, horn, Samspray; 38 gns.—Railway Garage, Staines. [X9482]

**LONGMAN** Bros., King St., Acton. 'Phone: 1578 Chiswick.—Before purchasing a machine, advise and let us quote. We don't think that we can save you money; we know it. [X9480]

**1915 A.J.S.** Twin and sidecar, good as new, complete, £75; 3-speed Triumph and sidecar, complete, £40; 1913 3½ h.p. Premier, 2-speed gear, cane sidecar, £35; 1913 Rex Sidette, £40; wanted, Morgan runabout, sale or exchange.—7, George St., Stroud. [X9237]

# G.K.

## SIDECARS

## The "G.K." IDEAL Two-seater.

A luxurious model for two full-grown adults, front seat detachable and shaped to allow knee room for the back passenger, spring back and seat. High-grade finish throughout.

Price - - - £15 17 6

## "G.K." MODEL No. 31.

A graceful coach sidecar with locker under the seat, spring back upholstery. For motor's 3½ h.p. upwards. High-grade finish. A popular model.

Price - - - £11 0 0

## "G.K." SIDECARETTE.

A featherweight sidecar, underslung chassis, solid cane body, covered with patent leather. Always clean, very strong, very light.

Price - - - £8 10 0

## The "G.K." Sidecar Co.,

LORENZO WORKS,  
LORENZO STREET, Pentonville Road.  
'Phone: NORTH 3805. London, W.C.

## MOTOR CYCLES FOR SALE.

## Miscellaneous.

**HEBDEN'S** have in stock now, no waiting:

**1915 Models** Royal Enfields, 24 h.p., 3 h.p., 6 h.p., and 8 h.p.

**TRIUMPH** Junior, New Hudson, Broughs, and Norton Big Four.

**ALSO** the following new 1915 machines to clear:

**1915 7-9 h.p. Harley-Davidson**, 3-speed; £78, accept £70.

**1915 7-9 h.p. Indian** and sidecar de luxe; £100, accept £87/10.

**1915 2½ h.p. Jap Imperial**, 2-speed, clutch and kick starter, variable ignition; price £44/4, accept £37/10.

**1915 2½-3 h.p. Wolf**, 2-stroke, 2-speed; £33/10, accept £28.

**1915 2½ h.p. Wolf**, 2-stroke Peco engine, 2-speed; £35/16/6, accept £30/10.

**THE** above are brand new, clean, and not shop-soiled.

## SECOND-HAND Bargains.

**1915 Williamson** Combination, 8 h.p., water-cooled; cost nearly £110, accept £80.

**1914 5-6 h.p. Rudge** Combination, splendid order; a gift, £55.

**3½ h.p. Humber** and sidecar, special machine; £38.

**4 h.p. T.T. Bradbury**, as good as the best; only £22.

**2½ h.p. Douglas**, 2-speed, clutch, and kick starter, in 4 really tip-top order; a rare bargain, £35.

**THE** Above are all really good and genuine bargains, fitted up complete with kumps, horns, etc., ready for the road.

**BRAND** New Williamson (Douglas) Cycle Car, 8 h.p. Douglas engine and gears, the smartest 3-wheeler turned out; £120, fitted up complete.—Call, 'phone, or write, Hebdens's Motor Mart, St. James's St., Bury. Tel.: 488. [X9427]

**PALMER'S** Garage and Motor Auction Rooms, 183, 185, 187, 189, High St., Tooting.

**PALMER'S** Garage, Tooting.—The pre-eminent place for purchasing. Auction sales fortnightly.

**PALMER'S** Garage, Tooting.—3½ h.p. 1915 T.T. Rudge Multi, 60 g. model, as new, very fast, £45; also 3½ h.p. F.E. model, £20.

**PALMER'S** Garage, Tooting.—2½ h.p. Wolf 1915 lightweight, 2-stroke, as new; £20.

**PALMER'S** Garage, Tooting.—4½ h.p. F.N., 4-cyl. late type machine, good tyres; bargain, £14/10.

**PALMER'S** Garage, Tooting.—2½ h.p. 1914 Aldaya Matchless 2-stroke lightweight, exceptionally good condition; £25.

**PALMER'S** Garage, Tooting.—2½ h.p. Royal Ruby lightweight, 2 speeds, splendid machine; £25.

**PALMER'S** Garage, Tooting.—3½-4 h.p. Douglas, 1914, 2 speeds, clutch, kick starter, fast, powerful, £45; 1912 2½ h.p. Douglas, 2-speed, £30; 1911 2½ h.p. Douglas, 2 speeds, £20; 2½ h.p. Douglas 1910 lightweight, £15.

**PALMER'S** Garage, Tooting.—2½ h.p. Enfield lightweight, 2-cyl., all chain drive, pedal starter; £18.

**PALMER'S** Garage, Tooting.—2½ h.p. Torpedo-Pre cisica lighting touring model, nice order; £14/10.

**PALMER'S** Garage, Tooting.—7-9 h.p. 1914 Quadrant and sidecar, 2 speeds, handle start; £40.

**PALMER'S** Garage, Tooting.—3½ h.p. Chater-Lea-Dion, mag. ignition; £8.

**PALMER'S** Garage, Tooting.—7-9 h.p. Indian T.T. model, as new, fitted disc wheels; £47/10.

**PALMER'S** Garage, Tooting.—3½ h.p. Humber and sidecar, 2 speeds, F.E., £18; also 2 h.p. Humber lightweight, £12/10.

**PALMER'S** Garage, Tooting.—Next Auction Sale 16th February, at 2 o'clock. Catalogues free. Entries invited.—Sole address, Palmer's Garage and Motor Auction Rooms, 183, 185, 187, 189, High St., Tooting. 'Buses, trams pass doors. Railway stations: Wimbledon (L. and S.W. Rly.), only 20 minutes; Victoria, via Balham (L.B. and S.C. Rly.). [X937]

**O.K.** Junior, 2-speed, 1915, as new, £25; 90° Jai Chater and Rudge sidecar, £50; 5-6 h.p. Martin brand new, £35; 5-6 h.p. twin, latest frame, re-amalgamated, £18; 2½ h.p. Kerry, £6; any exchanges. Call 'phone 93 Sydenham.—65a, Rosendale Rd., West Dulwich. [X0993]

**BARGAINS:** 30 shop-soiled motor cycles at 20% of list prices.—We have had placed in our hands for immediate disposal 30 motor cycles from 2 to 8 h.p. all by well-known makers; a few at even less price which have been used as demonstration machines.—Oracle Motor Cycle Co., 336, Gray's Inn Rd., W.C. [X913]

## The Value of Experience.

**J**UST over a year ago we mentioned on this page that the War Office were permitting manufacturers of Government motor lorries to visit the field of operations in order to study the actual conditions under which their vehicles were being used. At that time we took it for granted that the same privileges would be extended to motor cycle manufacturers, and we expressed our satisfaction at the new move, which, to our mind, was destined to prove of great benefit to the country in general. Subsequently, however, it transpired that motor cycle manufacturers had not been invited to visit the war zone, useful though the educational value of a visit would have proved in respect of the elimination of weak points and in desirable modifications on future supplies. It may be recalled that at the end of last summer, when we were embarking upon the second winter campaign, *The Motor Cycle* drew attention to the fact that machines of standard design were still being supplied to the War Office, though it was common knowledge that they possessed a number of unsuitable features which had been brought to light by the extremely adverse conditions existing in France and Flanders. The fact that they were of a minor order, and comparatively easily eradicated, served only to aggravate the position. We expressed astonishment that the faults had not been eliminated long ago, since it had been demonstrated beyond doubt during the previous winter that the items in question were inadequate and not up to their work. We refer to weak forks and fork links, inadequate mudguarding, unsuitably designed touring handle-bars, hubs which were not entirely weatherproof, and so on. Two very obvious courses were open for the eradication of those weaknesses, viz., either an authoritative report by practical motor cycle engineers at the Front, or a thorough insight into the conditions under which the machines were used by representatives of the producers.

Since that time the second course named has been adopted, and in this issue we publish impressions by manufacturers' representatives who have been privileged to visit the various base camps and consult officers at repair bases as to the most prevalent causes of trouble, and the desirability of modifications in design. The four firms regularly supplying motor cycles to the Government, viz., Triumph, Douglas, Clyno, and Phelon and Moore, have within the last three months paid visits to the war zone, and we predict that this belated move will produce results of general benefit to the country, not to mention the convenience and safety of the motor cyclists using the machines. We may also venture to recommend that further systematic visits should be allowed and even encouraged. Already we have dwelt upon the fact that certain parts, even on comparatively new machines, have in the past been constantly scrapped on arrival in France on account of their proved unsuitability, which is not only a waste of money but a waste of time on the part of mechanics in effecting the necessary changes, particularly when it is remembered that these unsuitable points of design might well have been rendered non-existent at the fountain head, i.e., at the works. A further development of manufacturers' visits to the war theatre may eventually be the adoption of real lightweight machines for winter conditions. We are still firmly of the opinion that the handy and stable lightweight solo mount would prove advantageous to despatch riders during the winter months, when it is usual for the roads to be several inches deep in mud. Pace during this period is not wanted, and is, indeed, impossible, and, judging from all accounts, falls far more frequent in the case of heavy machines than they need be. We have good grounds for stating that the Government are none too favourably disposed towards two-stroke engines at present, which is unfortunate, as this fact provides a natural bar to the adoption of lightweight motor cycles.

PAINTERS of landscapes and country scenes are usually regarded as sedentary individuals, probably because they are not generally recognised as artists except when they are seen in reposeful attitudes with brush and canvas. But, as a matter of fact, there are few free-lance professions in which it is so vitally necessary to keep on the move, and to make oneself thoroughly acquainted with the country one has chosen to work upon. As a rule, the artist who remains near home in time becomes stale, and sooner or later he experiences difficulty in finding new subjects or new inspirations. The old scenes lose much of their interest, and work acquires a sameness that is sorrowful to contemplate.

The natural impulse when this occurs is to get right away and try something new—a step one should have taken long ago—but when the actual pinch of necessity comes, the way is not always so easy as it might have been earlier.

Realising all this two years ago, I decided to fling the slender sum of my worldly possessions into the purchase of a motor cycle and sidecar outfit. It was a desperate move, and meant risking the anger of a kindly old aunt; but the case demanded desperate measures of some sort, if only to save the beloved old aunt from the bankruptcy court and myself from the sticky profession of bill-posting. So in due course the speculation was made, and, having survived the initial shock of purchase, things began to prosper.

To-day I regard my sidecar outfit as a necessary part of my professional impedimenta, and am often led to wonder how artists who are compelled to remain amidst surroundings that are not entirely congenial manage to root up sufficient material to keep themselves fully employed. During my jaunts over the moors and through the valleys, from one scene of activity to another, I am constantly stumbling across views or incidents that suggest my next picture, and can safely say that the incessant struggle for new ideas ceased when I joined the cosmopolitan brotherhood of motor cyclists.

Before this happy event took place I imagined myself to be thoroughly familiar with the country in which I was then living, a region of hills and hollows and unexpected little flowery nooks. But before I

had possessed the machine a fortnight I began to realise my mistake. I discovered two villages within five miles of home that I had never seen before. One of these was a ruined and deserted little hamlet, overgrown with great beds of nettles and disorderly elderberry bushes. The roses which had once adorned the gardens had become wild, and hung in festooned masses about the walls. Starlings whistled shrilly from the shattered window sills, and about the whole place was an atmosphere of peace and abandonment.

It was while cautiously wending my way home along a narrow, overgrown lane, that no one seemed to use, that I discovered this former abode of habitation. A water-splash had to be negotiated on the way, as the autumn floods had swept away the bridge. Next day I came again with a tent and full camping outfit, and made camp in the midst of the abandonment. I found that most of the neighbouring villagers knew of the place, but that few of them had visited it. For a week I had

A deserted Village

the spot to myself, and finally produced a picture which was a great factor in the building up of what little success I have since enjoyed.

A score of times since then my motor cycle has been instrumental in the similar discovery of scenic gems, and in summer time it is a joy to possess. So much of one's success in this line of business depends upon keeping one's mind fresh with various scenes at various seasons. It is a great help to one's productive powers to be able to visit distant and varied scenery, and a motor cycle affords a cheap and excellent way of doing this effectively. Running expenses and depreciation are nothing to the comparative value of being able to get from one valley to another, or even from England to Scotland, quickly and easily.

Then there are periods when one becomes worked out, and when it is just as well to drop business for a time. When this happens I usually pack a few belongings into the sidecar, and go off for a random tour with camera aboard. Of course one is compelled to take brushes and canvas, for these things become part of one's anatomy, but it is best to forget that they are there, and to devote oneself strictly to the camera. The photographic results are of value in

**Highway and Byway with Brush and Canvas.**

that they sometimes provide food for reflection during seasons when outdoor painting is impossible.

**The Search for Subjects.**

The choicest scenes are seldom found by the broad highways. One has to leave the beaten tracks and haunt the seldom frequented lanes—over the mountain passes, through narrow woodland byways, across stretches of moorland, where the wheel tracks have become the beds of tiny brooks, and where steep ascents are the order of the way. The subjects that make the strongest appeal (to me, at any rate) are usually found in the most unexpected places—an abandoned limekiln in the midst of the heather, a decayed and tumbling bridge miles away from anywhere. A glimpse through the trees or between the hills, and one jams on brakes and turns back, vaguely fearful that the scene may suddenly transport itself to another portion of the globe.

All one's outfit has, of course, to be carried in the sidecar—how one recalls the sweltering summer days when one carried it shoulder high from place to place!—and therefore a powerful machine and one of really good design is necessary. One must be prepared to go anywhere, and my experience is that rough riding does a machine very little harm. My present mount is only  $3\frac{1}{2}$  h.p., but it has never failed me, though very few artists—they are much the same temperament in this respect—would trouble to keep their engine in proper tune. A chain-driven twin is probably the right thing for the work, but most twin sidecar outfits are so heavy that I prefer my own single and featherweight sidecar. The jolting strain on a really heavy machine when negotiating rocky mountain roads must be out of all proportion to the strength of construction, founding one's comparison on the construction of a well-made single; at any rate, I have negotiated mountain tracks on which a heavy twin failed utterly from back wheel slip.

**The Convenient Sidecar.**

But this is probably a matter of taste, and, given a good sidecar machine of any type, one is not likely to fail to accomplish any reasonable feat. To stick on a bad hill when one has all one's kit aboard is, to say the least, annoying, and, further, it is extremely dangerous to sit still in an exposed position when one has become overheated beforehand. It is vastly important, both for one's work and one's health, to arrive on the scene of work in a cool and comfortable condition. Personally, I always carry a length of rope in the sidecar for roping the back wheel, and this often saves the situation when greasy ascents are to be made.

The sidecar comes in useful as a seat from which to work, as it is more comfortable and far more sheltered than a stool. An artist's folding stool shelters

one from the wind about as much as a small boy's bathing costume would shelter a fat policeman from the waters of the Yukon in mid-winter. When one has to sit for hours in a draughty little valley on an autumn day, a comfortable sidecar is much more to the point. I use my sidecar whenever it can be conveyed to the scene of action, and it is surprising where one can get a motor cycle when one really tries.

Summing up, I am convinced that when I purchased my machine I made the best investment it has ever been my good fortune to run up against. Probably success would duly have arrived had I followed other lines, but it is very clear that without the machine I could never have had so many strings to my bow as I have to-day. Solely on account of the ease with which I can get about, I recently procured a standing order for an annual series of pictures for calendar production. This commission took me to Holland two years ago, where I motored from one agricultural centre to another, and would have taken me to Belgium last year had not events taken an unhappy turn. When touring in Scotland, however, I happened to see some shepherds at work with a new process which suggested a substitute for the Belgian series, and so I succeeded in holding down the commission—thanks again to the motor cycle.

**The Salmon Poachers.**

While wandering about the country I have picked up a hoard of information on various subjects, most of which will come in useful sooner or later. On one occasion I stumbled across a gang of salmon poachers at work on the Tweed, and forthwith produced a picture that sold at once to a sporting landowner of the vicinity. This gave

me the hint that it was worth while remaining in the district and making a series of salmon angling pictures. It cost a bottle of whisky a day for the gillie, but he deserved it, since he was often called upon to stand thigh deep in the chilly Tweed for long periods at a stretch in order to give me the correct attitudes. I knew that I could get my own price for really good work, and in the end the sporting landowner and I parted on the best of terms. He even gave me another commission.

And so, since I became a motor cyclist, I have established business connections and acquaintances all up and down the country, and consequently need never be short of work. The kindly old aunt no longer dwells beneath the shadow of the bankruptcy court, and has even acquired a quizzical interest in that diabolical invention on which I shin up and down this flower-strewn island. At any rate, she made no complaint when I razed a whole row of geraniums while giving an exhibition ride for her benefit round the back garden. Possibly this was because her interests were centred on the cat, which was racing within a yard of the front wheel throughout the whole of the performance.

H.M.B.

## Combining the Pleasures of Motor Cycling and Boating.

THE motor cyclist whose home is situated within easy reach of a river or lake suitable for boating is much to be envied, and those who have once experienced the pleasures to be obtained from such enviable environment, and have, for some reason or other, been compelled to change their place of residence to some part far removed from a good stretch of water, must feel an almost irresistible longing, during their leisure hours, for the opportunity to indulge in their former pastime.

To the boating enthusiast, the call of the river is as strong as is the call of the road to the enthusiastic motorist, and nothing else can fill the void created by the absence of facilities by which to satisfy it. In these days the motor cycle has been largely used by many keen boating men and women to enable them to enjoy their favourite pastime, and it would be almost impossible to find a spot in these islands in which a good piece of water could not be reached in quick time by means of a motor bicycle or sidecar outfit.

Many river men are fond of taking their pleasures in a motor launch or boat, but the cost of maintaining and housing a motor boat at some distance from their place of residence often causes them to give up the idea. One way out of the difficulty, however, is to purchase a portable boat-propelling motor, such as the Evinrude, the Motogodille, and others which have been designed so that they may be attached to the sterns of ordinary river rowing boats.

The weight of the Evinrude motor complete is under 56 lb., and it may be packed in a box 12in. wide and

15in. long, which may be conveniently strapped upon the carrier of a motor cycle. It is a 2 h.p. two-stroke horizontal water-cooled engine, which is capable of running in either direction by alteration of the firing point of the ignition apparatus. Either battery or magneto ignition is fitted according to requirements. The screw propeller is driven by a vertical shaft through bevel gearing, and the motor pumps its own cooling water from the river. The petrol system of lubrication is employed, and the tank has a capacity of three-quarters of a gallon, or sufficient for a six to seven hour continuous run. One-third of a pint of Vacuum A oil is required to each gallon of petrol.

A rudder controlled by a hand lever is attached to the vertical shaft casing, and all that is necessary in fitting this portable motor to an ordinary rowing boat is to remove the rudder of the boat and clamp the portable motor in its place by the screw clamps provided. The attachment has proved to be most useful for quickly reaching secluded spots, well removed from the popular parts of rivers, where fishing and bathing may be indulged in. These spots are often remote from any roadway, and are some distance from the boathouses. A boat fitted with an attachment enables these quiet retreats to be reached with ease and in comfort, for a speed of six to seven miles per hour can be readily maintained.

On the return to the boathouse the motor can be packed up and the return home made in comfort by road after a day full of varied pleasure.

### Reviving the Tricycle.

In the early days of the motor cycling era I spent a winter in very difficult country; the hills were severe and full of corners; the lanes were greasy and tortuous; and the top-heavy, high-framed bicycles of the day were very awkward things to handle. I have just spent a week in rather a similar district, and have been very thoroughly put through it by a lad of sixteen, riding a weaker mount than my own. I handled four different machines during the week, and must say that the multi-geared Baby two-stroke struck me as the pick of the bunch under the arduous conditions, its sole defect being that at the foot of a precipitous dip it was somewhat slow in picking up, as the lubrication was usually excessive during the previous drop, which might be as long as a mile in many cases; the consequence was that it sometimes baulked in my endeavour to rush the climb out of the valley. During these experiences my thoughts wandered back to similar experiences long since gone by, and I still remember gratefully how I then revolutionised my winter riding by temporarily reverting to the tricycle. In those days I had more money than brains (nowadays the situation is reversed!), and I bought successively a De Dion, an Ariel, and finally a tricycle of my own design, with more weight inside the wheelbase than the Ariel; the defects of most tricycles were that the bulk of the weight was concentrated behind the rear axle, rendering them back heavy, and the direct gear drive was excessively noisy—you could hear them grinding a mile away, like threshing machines.

### Some Possibilities.

Musing on these ideas I further recalled the successor of these antique tricycles—an Ormonde tandem two-seated motor bicycle. And methought that if some first class firm would even now concentrate on a good modern tricycle it should achieve excellent sales amongst the all-weather dwellers in country districts, especially in more difficult counties. Such a machine does not skid; its steering is unsurpassable in tricky lanes; it goes comfortably on big tyres; winter puncture repairs (the all-weather man's bugbear) are eased, because one can put in a new tube in the side wheels in five minutes, and the front wheel hardly ever punctures. Then if the wheelbase were still further elongated, and the seating altered into the tandem style, with the front rider in charge of the controls, the machine would be equally docile with either one up, or two; and the combination would, in this respect, be infinitely superior to the sidecar, now fitted by many mudlarkers, and always rather tricky to handle when "she" is not aboard.

### An Objection.

I do not consider that the extra track is of any real moment for this special market, as the machine would be intended for rough work, and in some counties you cannot find decent going for a two-tracker, e.g., a sidecar. The main difficulty is that tricycle steering

is something of a lost art. Nevertheless, it is certainly easier than sidecar steering. Any man who has never ridden a bicycle can manage a tricycle at his first essay, for the steering is natural and automatic until one has acquired the artificial balancing instincts of a bicycle front wheel; and nobody can say that sidecar steering is natural. If I were head of a firm in a big way of business I should be much inclined to put through an experimental batch of, say, a hundred tricycles, fifty tandems, and fifty single-seaters; to enter them in the big trials; to entrust a few to good riders up and down the remoter and hillier counties, and so to test the possibilities of an untried market.

### "Top Feed" Carburetters.

A correspondent asks me "to wield my vitriolic pen" in denunciation of carburetters which have the petrol feed pipe attached to the top of the carburetter instead of the bottom as aforetime; he says it is a great help in diagnosing troubles to slip the lid off the float chamber and so discover whether the fuel system is blocked. He has surely overlooked the two facts that the same test can be effected either by tickling the float and watching for dripping petrol or by noticing the feel of the tickler, which seems and sounds quite different when the chamber is empty. I have no doubt whatever that the top feed is the better arrangement; it keeps the needle steadier, and so prevents much waste of petrol and disturbance of mixture by flooding due to vibration. I have never had a conversation with an expert on the point, and there may be other advantages which have escaped my notice; but even on this one point my answer is "Declined with thanks."

### An Engine Seizure.

I have not infrequently seized up a four-stroke engine, but never until this week did I encounter this particular mishap with a two-stroke. I was over-driving a new two-stroke, and up a very long hill signs of seizure became apparent, and as soon as I dismounted the engine became immovable. Fortunately a two-stroke is well adapted for treatment in such cases; the sparking plug is often in the centre of the cylinder head, and if one has petrol lubrication the tin is just the right thing for copious injections. I whipped out the sparking plug, mixed two tins full of equal parts of oil and petrol, and slushed them in through the sparking plug orifice, doubtless at some risk of cracking the red-hot piston; the first dose boiled and sizzled, the second went in more quietly. As soon as the second tinful was in, low gear was engaged, and the piston was rocked slowly backwards and forwards till it freed itself. Before taking the road again the usual proportion of oil in the petrol tank was trebled. When I called for supplies at the garage in the next town I mentioned my mishap, and the agent informed me that two riders of two-strokes had pushed into his shop in similar trouble on the previous Saturday.

## A VISIT TO THE WAR ZONE.

Impressions of a Ten Days' Sojourn Among the Repair Bases.

RECENT note from Lt. Rowlandson at G.H.Q. read as follows: "Next time you see Hulbert, ask him what he thinks of shell." Accordingly we sought out Mr. Hulbert, motor manager of the Triumph Cycle Co., who, we knew, had been on a visit to France with Mr. Franklin, the works manager of the company, to see the actual conditions under which Triumph motor cycles are made at the Front. We found Mr. Hulbert very communicative and deeply impressed with the perfect organisation, optimistic vein, the sense of security pronounced in and near the war zone, which forms a striking contrast to the conditions which existed in the early days of the war.

On the visit of Messrs. Franklin and Hulbert occupied ten days, during which they were transported from one place to another—thirty in all—and were out going from 8.30 a.m. until 9 or 10 p.m., seeing all there was to be seen of interest and benefit to men whose special duty it is to produce the most reliable type of motor cycle for our army in the field. Everywhere they went they were greeted with flattering remarks on the quality of the trusty Triumphs, and the satisfactory service which has been rendered by them. Naturally, they saw a good many motor cycle lists whose names are well-known to our readers, and on two days of their trip were, in fact, piloted by Lts. S. Rowlandson and C. T. Newsome, of the A.S.C. One of these days, indeed, was the most exciting of the trip.

### Using a Visitors' Book under Shell Fire.

It was a visit to Ypres, which is now but a heap of crumbling ruins, except for the prison and the water tower. To the prison they added their way, and whilst using the visitors' book with at ceremony they heard a shriek overhead, and a shell burst eight yards away and buried itself in the ruins. The visit continued for ten minutes or so, and the civilians were informed that this was quite the regular reception when a motor car visited the prison. This section is, of course, one of the hottest along the whole Front, and was, in fact, nearer to the German

line than any point touched. What puzzled Hulbert at the time, and is still puzzling him, is whether the prison being left intact was intentional on the part of the Germans or otherwise. Then, all having been quiet for fifteen minutes or so, the guides suggested quitting Ypres without delay.

A mile out three more shells shrieked overhead and fell in quick succession, but sixty yards away this time. As may be imagined, "Bush" Newsome, who was driving, fairly accelerated. At Poperinghe a search was made for Sgt. J. Cocker (M.M.G.S.), the well-known Brooklands record holder, who was formerly with the Triumph Co., and knows what a good motor cycle should be like, but, though his quarters were discovered later in another district, it was found that he was on leave. Curiously enough, he was almost the first person Hulbert met on his return to England. Another friend Hulbert was most anxious to trace was Flight-Commander H. Lister-Cooper, of the R.F.C., but it was not to be.

### The Road Conditions.

In Belgium the Triumph representatives found the roads at their worst. The *pavé* in the centre is not so bad, but the excessive camber is very troublesome to solo riders. At the sides there is any quantity of mud, which would make the most experienced rider quake. But *pavé*, the *bête noire* of tourists, is a godsend to military men, as it renders riding possible, albeit extremely uncomfortable.

The road conditions in France are a great deal better, for what is mud in Belgium and was formerly mud in France has latterly been transformed by British Engineers into a fairly rideable path. The *pavé* in the centre, too, is better. Generally speaking, our informant found the roads to be in better condition than he had pictured from the accounts he had read, and from what he had expected in view of the excessive traffic, which, near the firing line, formed one continuous line. Whereas in Belgium the motor cycles were choked with mud, and the riders complained that they had no inclination to waste time in keeping them clean, the machines on the British Front were noticeably better kept. Despatch riders were constantly seen fitting about in all directions on duty; and machine gun sidecars, too, formed an interesting change to the observers.

### No Departure in Design Contemplated.

Questioned as to the possibility of any change in design directly resulting from the visit to the Front, Mr. Hulbert said that he contemplated no radical change; and, indeed, the reports were generally that the Triumph machines were giving most excellent service despite the strenuous conditions under which they are used. Detail alterations here and there may be effected sooner or later. For instance, not unnaturally, the men find that the standard touring handle-bars are not the best for the work, and as a regular thing bend the bars outward.

As a result, the Triumph representatives took a pattern, and propose to repeat the design on future W.D. models if the desire is officially confirmed. The desirability of T.T. bars was urged in the columns of *The Motor Cycle* months ago, and in connection with the opinion expressed that important changes are not anticipated as the result of war experience, one can only reiterate that this is proof enough that the competition work in this country has evolved a machine which is able to perform satisfactory service under all conditions. This should be good reading to those officials of the A.C.U. who planned the strenuous events which created strikes and gave rise to grumbling in pre-war days.

A snapshot taken in Ypres, which gives a graphic impression of the damage done by heavy gun fire.

### A Visit to the War Zone.—

An interesting alteration on some of the machines which amused the Triumph men was the alteration of the Sturmev-Archer change-speed gear lever, so that the changes of gear might be carried out with the foot. To do this, one or two D.R.'s had fitted the lever in an almost horizontal position, and had then bent the operating lever round at right angles. This struck the writer as being a smart idea, as it enabled the gears to be changed without the necessity of removing the hands from the grips. No rider at home can appreciate this point sufficiently well. Falls are frequent owing to the slippery state of the roads, so that any departure to assist in the control of the machine should be of great benefit.

The chief repair base for cars and motor cycles covers no less than three acres of ground. In these workshops many old acquaintances were met, including E. A. Burney, A. C. Riley, S. Whitam (late of *The Motor Cycle*), F. Lamb, and others.

### Possibilities of Two-stroke Lightweights.

We enquired as to the possibilities of lightweight two-stroke machines being used at the Front, and were told that, curiously enough, this had formed the topic of conversation with a number of well-known men. Hulbert shared our view that the handy little lightweight

would be ideal for winter use when fast speeds are not necessary and the road surfaces have a thick covering of slimy mud. It would appear, too, that many practical riders are in entire agreement, but the military authorities who settle such questions do not seem favourably inclined towards two-strokes of any kind.

We have already mentioned that Messrs. Franklin and Hulbert were kept very busy during their sojourn, and frequently it was necessary for them to make enquiries at Staff Headquarters quite late at night, and they were very much impressed with the fact that Staff officers were always on tap at any hour up to midnight, Sunday included; and to suppose for one instant, as M.P.'s

Foot-operated change-speed gear on a W.D. Triumph—a war zone alteration made to many Triumphs over in France to facilitate gear-changing on greasy roads.

have suggested, that Staff officers have an easy time is entirely and utterly fallacious.

### Excitement of a Night Trip.

Night driving was most interesting to the pair. Star shells lit up the firing line, and it was quite a regular thing to see shells bursting, and that not far away. It might be added that they were not troubled with subdned lamps or lamp discs, or any impediments of that kind. Near Bethune an air fight was witnessed, and before the aeroplanes came into touch, five shells from anti-aircraft guns were fired at the Taube and were plainly seen to explode all around it.

The return trip of eighty miles to the port was commenced on a Wednesday afternoon, and took a day and a half. Nearing the journey's end, it was discovered that the boat would have left nearly two hours when the train arrived, so they sought out the military headquarters, and, the Commandant appreciating the position, kindly provided a car and driver, which enabled them to catch the steamer. But there was still an unpleasant surprise in store, for both were locked up for two hours, with a military guard over them, by the French authorities, owing to the fact that their passports had not been *visé* by the French. They were, however, released just before the boat left, and reached English soil greatly impressed with what they had seen and heard.

## More American Impressions.

### An Interview with Mr. Robertson-Brown on his Return from the United States

**W**E were very glad to have the opportunity of having a conversation with Mr. Robertson-Brown, who is the agent for the Henderson in this country, after his first visit to the United States. Asked about his impression of the condition of affairs in New York, he said that the roads were exceedingly bad in that city. It was practically impossible to ride a motor cycle except in the main avenues, the other streets being obstructed by tram-lines and paved with rough stone setts. The traffic was not nearly so well controlled as in London, and though on the whole it was not badly done, Great Britain easily led in this respect. The traffic was regulated by signals marked "go" and "stop." For all the boasts of the smartness of the American the vehicles in the streets travelled faster in London than in New York.

### Chicago Mounted Police.

The plan adopted in Chicago is to have the traffic controlled by a policeman on horseback, which Mr. Robertson-Brown considered to be a very good idea. This mounted policeman stood at a cross-road, and on his taking up his position in the centre of a certain road he stopped the traffic not only in that road, but in the road opposite to him, allowing the vehicles to pass at right angles. When a sufficient number had passed he moved in a clockwise direction to the next street, with the result that the street previously available was closed, and the street previously closed was opened. Thus, as

long as he was on duty he continually moved in a circle, and stopped at each quarter revolution.

### Not Many Motor Cycles.

Mr. Robertson-Brown noted with surprise the fewness of the motor cycles he saw in the United States during his nine weeks' stay. It appears that the motor cycle is very popular with artisans and workmen, and many even of these used Saxon and Ford cars. It seems that the average middle class man prefers a car, and the American cannot understand the Englishman's great fondness for the motor cycle. The American cannot perceive why an Englishman who can afford a car, and often owns one, should at times prefer the sporting two-wheeler. In sidecars England easily led. Sidecars are not popular at present in the States, but pillion riding is very much in vogue. He was very much astonished at the vivid colours in which American machines were painted, the Harley-Davidson and the Henderson being the only machines which wore a moderate hue. He did a certain amount of motor cycling while in the country, and rode twenty-five miles out from New York, and found the road surface quite good in that district, and also around Boston, if one kept to the main highways. He only once saw one of the famous New York motor cycle policemen. These men chase a motorist who is driving too fast, and when they catch him deliver a summons on the spot. He was extremely surprised to see the amount of horse traffic in New York, and thought it was certainly more pre-

valent in this city than in London, and was horrified to see steam and horse trams still in use in some streets. During the whole of his stay he only once saw a woman riding a motor cycle.

### A Collision.

He told us an amusing story of how young Mr. Henderson, of the Henderson Motor Cycle Co., when handing him over one of the new 1916 Henderson machines for trial, refused to let him start because he was wearing no hat. Mr. Robertson-Brown is, generally speaking, one of the hatless brigade, which apparently has not been heard of in America. He was once a witness of a collision between a motor cycle newspaper delivery carrier and a tram. The tram was obviously in the wrong, but the driver thereof got two witnesses on his behalf. When Mr. Robertson-Brown went up to the motor cyclist and asked him if he could be of any assistance, the tram driver was most indignant, and in language more forcible than polite told him to get on the sidewalk, where he belonged. Quite a long argument ensued, but as soon as one man had come forward to champion the cause of the motor cyclist others were soon available.

We were very much interested to hear Mr. Robertson-Brown's views of the States. Usually the people one interviews after a visit to America are those who have been over several times before, and who are consequently not so vividly impressed as those who are visitors for the first time.

## TRIAL of a 1917 Model 4 HP. Douglas.

Nearing the summit of Weston Lane, near Bath.

### A Tour of the Douglas Works. Hill-climbing with W.D. Models.

**L**AST week we were invited to pay a visit to the works of Messrs. Douglas Bros., of Bristol.

Our visits to the Douglas Works are not nearly so frequent as we should like them to be, and the transformation scene on each successive visit is really something at which to marvel. Year after year the works have been extended, and the output of motor cycles correspondingly increased, until now the firm have a huge factory with the most modern equipment. It is practically self-contained; indeed, we know few motor cycle manufacturers who produce more of their own machines in the works than is done in the Douglas factory. The extensions are not yet complete, however, and Mr. Douglas talks of a weekly output of 500 machines after the war. For some time the firm have had an iron foundry as well as a foundry for brass and aluminium castings, but the latest addition is equipment for aluminium die castings, which are likely to be much heard of in the future. On our arrival at the works A.S.C. men were busy putting through their paces in instalments a batch of machines

representing the weekly output of Douglas 2¾ h.p. and 4 h.p. models for the Army. The practical and workmanlike black finish of the different parts evokes praise, and we shall be surprised if W.D. models do not figure in catalogues when the Germans are beaten!

#### A New 4 h.p. Douglas.

After a tour of the works in company with Mr. W. W. Douglas, during which old memories of the Douglas were constantly revived, we inspected an entirely new model 4 h.p. sidecar outfit which represents the firm's 1917 design, though certain modifications may be made as experience dictates.

Surely this is the first 1917 model yet heard of, and by reason of the fact that it is so far ahead of the

Part of the weekly batch of Douglas 2¾ and 4 h.p. models for the War Office.

### Trial of a 1917 Model Douglas.—

times, some details of it should prove particularly interesting. The machine has now completed 2,000 miles of wintry roads. Regularly every day it traverses a long distance in the hands of a tester, who sends a telegram on arrival at his journey's end, and the firm have made a rule that no work or attention shall be given to the machine. The chief departure from standard is the all-chain drive enclosed in chain cases. The engine is supported upon a double platform, providing greater rigidity, and has, of course, the latest mechanical lubrication system, with an inspection window in the crank case sump already described. The bore and stroke are  $72 \times 68$  mm. = 544 c.c., the cylinders having been redesigned and the fins rounded off, giving them a very neat appearance. In the new

shafts being on the same level. The changes of speed are effected by a clever design of interlocking lever situated in the usual Douglas position at the forward end of the top tube. The handle is hinged, while the vertical rod has a telescopic action, preventing the rider changing gear until the clutch has been released. By this means damage to the gear teeth by novices accidentally changing gear without declutching is precluded.

A decided improvement is the transference of the kick-starter from left to right, and a further advance is the greatly simplified method of operating the clutch. The action of this member is now governed through the centre of the shaft from the opposite side to the present model, thus doing away with the numerous springs, bolts, nuts, etc., which not only complicate manufacture but also hamper the overhauling process.

### The New Plate Clutch.

The clutch has plates consisting of specially prepared leather, which are dropped loosely into position, and by reason of the fact that they are not

J. Phillips climbing Weston Lane, Bath, on a  $2\frac{1}{2}$  h.p. W.D. model, followed by a 4 h.p. sidecar outfit.

Near the top of Lansdown Hill. A 1916 and 1917 model sidecar outfits.

The old monument at the top of Lansdown Hill, bearing the date 1643.

pattern cylinder casting the ports are arranged tangentially; former 4 h.p. models have straight outlets. The interior design of the ports now approaches streamline formation, enabling free egress for the burnt gases. The gear box and clutch, too, are of a new type. The box has a smooth exterior to prevent dirt collecting, and three ratios of speed are provided, the

fixed in any way, it is a simple matter, should it be necessary, to add a plate when the original ones have worn down. The method of testing this clutch will interest not a few as showing the care and precautions taken to ensure that something practically indestructible is adopted. The machine was placed against a wall and for two hours the clutch was constantly engaged with a view to burning out the plates, but without success. It will be some guide to readers to know that a cork clutch subjected to the same treatment gave out long before the new composition plates. On this new 4 h.p. model is fitted the latest type of Douglas fork with shock absorber combining a horizontal motion

**Trial of a 1917 Model Douglas.—**

with the upward motion, and the sturdiness of its construction cannot fail to be noticed.

Another entire departure for the Douglas firm is the adoption of detachable wheels—a patent of the company dispensing with distance pieces, and, of course, allowing the transmission, brake mechanism, etc., to remain *in situ* when the rear wheel is dropped out by the removal of the spindle. The rear brake is of the internal expanding type with the operating lever mounted separ-

The latest design Douglas-Amac carburettor, which has a warming jacket, heated by a pipe from the front exhaust pipe. A second pipe communicates with the silencer.

ately from the footboards. As to the power of the foot brake, we had ample proof during tests which we were later privileged to carry out. This new 4 h.p. Douglas makes an ideal sidecar mount, it is not heavy and cumbersome, and as a result is economical in petrol and oil consumption and comparatively light on tyres. The machine will be sold complete with a very neat coach-built sidecar, the *tout ensemble* presenting a very pleasing appearance. The sidecar is attached to the bicycle by four separate connections, and at present the body is suspended on coils at the front, and a transverse spring at the rear.

**On the Road with the 1917 Model.**

It was the 4 h.p. 1917 model that we selected as our mount to go in company with the 2¾ h.p. and 4 h.p. War Office models which were to be demonstrated to us on Lansdown Hill and Weston Lane, near Bath. These two hills are well known to West-country riders, and have frequently figured in competitions. The machine we were on made very light work of Lansdown Hill, simply toying with the gradient on the lowest gear, and showing its ability to restart on the steepest section with three passengers. Even the combined efforts of heavy roads and a howling gale beating the rain into our faces could not suffice to hold up the hill-climbing Douglasses. At the top we paused awhile to examine an old war monument bear-

ing the date of July 5th, 1643, where "In this battle on the King's part were more officers and gentlemen of quality slain than private men."

Weston Lane was in a particularly bad state owing to continued rain, the chalky surface adhering to the wheels with remarkable tenacity. To climb to the summit from the village is a test for any passenger outfit—the bicycles we almost ignore, for Phillips, the erstwhile competition rider, flashed past us on two occasions on his upward flight, proving that the gradient was nothing to a good Douglas bicycle, whilst W. W. Moore (our skilful pilot) demonstrated that a restart could be made without difficulty on the steepest portion of Weston Lane.

**Testing the Weatherproof Qualities.**

After lunch at Bath, during which time the rain continued to beat down pitilessly, we had a fast run home through Hanham over roads churned up by the heavy traffic and abounding in surface water. Mr. W. W. Douglas, who was piloting our photographer on a W.D. 4 h.p. model, was doing his very best to draw out the 1917 model, particularly on hills, in order to observe the difference, and it is enough to say that the pace was hot! But our horizontal twin never faltered, save once, when a blob of mud was flung on to the front plug, but without dismounting it was removed with a rag and the engine continued to fire merrily. The kick of the new 4 h.p. is amazing. The makers have so specialised on this engine that they have now no hesitation in asserting that it is at least as good *pro rata* as the 2¾ h.p. model—and that is saying a good deal. Its balance and smooth running qualities are such that an experienced rider could not detect the absence of a shock-absorber in the transmission.

The 1917 Douglas 4 h.p. sidecar outfit. It has enclosed chain drive, detachable wheels and a redesigned engine and three-speed gear box.

## A Road Warning.

The Evesham-Cheltenham road is in a very bad condition, "pot-holes" being abundant.

## Cycle and Motor Cycle Trades Benevolent Fund Concert at Birmingham.

The seventh annual Bohemian concert took place at the Grand Hotel, Birmingham, on Saturday last. Several short addresses were given, and it was pointed out that, with a centre membership of 850, £630 had been distributed in relief during the past year. A number of new members were secured in the interval for refreshments. The members of the centre were previously entertained at tea by the president, Mr. Dover.

## AN ITALIAN MOTOR CYCLE WITH AN AMBULANCE TRAILER.

## By Road to the Races.

It has been announced that trains are not available for race meetings, consequently all those who journey down to Kempton Park have to go by road, with the result that the stalls and paddocks where thoroughbreds used to stand are now occupied by motor cycles.

## A Warning.

An officer recently had occasion to take his machine from Victoria to Euston, but, finding that it would not fire, and being pressed for time, left it in a neighbouring garage to be overhauled and cleaned. Four days later he called for the machine, and was presented with a bill for £1 17s. 5d. He protested that the machine had not been cleaned; the manager refused to look at it, but deducted 1s. from the bill. Also 6s. was taken off in respect of two Lodge plugs which were not required, 2s. being charged for their

use (without instructions). The sole fault in the machine was that one of the magneto brushes had stuck. The moral of this is, of course, that it is always wise to obtain a written estimate when dealing with strangers.

## A Transfer to the R.F.C.

On Saturday we met 2nd Lient. John Gibson on the road near Stratford-on-Avon, and were interested to learn that he has been successful in obtaining a transfer to the Royal Flying Corps, and is at present receiving instruction in aeroplanes at Reading, where Harold Karslake is the sergeant-instructor.

## Bristol-Tewkesbury Road.

The Bristol-Tewkesbury road is in a really terrible condition at places, there being at least 3in. or 4in. of liquid mud after a fairly heavy shower of rain. This is apparently due to the amount of heavy traction engine traffic which passes over it.

## A.C.U. Subscriptions.

The A.C.U. secretary reports that a number of members of the A.C.U. are renewing their subscriptions for 1916. Many of these communications have been received from officers and men who are in the trenches, and from others who are serving their country in various parts of the British Empire and abroad.

A motor cycle trailer ambulance constructed by Messrs. Stucchi and Co., of Milan, in use in the Red Cross Service of the Italian Army. It will be observed in the right-hand photograph that accommodation is made for the soldiers' rifles on the cover supports. When loaded up with four people as in the left-hand photograph, we can well believe that the motor bicycle has a very busy time on the Italian mountain passes.

*In answering this advertisement it is desirable to mention “The Motor Cycle.”*

**Protecting the British Magneto Industry.**

It is suggested by the Sub-committee of the Advisory Committee to the Board of Trade that a tariff of 33½% be imposed on foreign magnetos, for the protection of the home industry, after the war.

**Ladies' Motor Cycling Costumes.**

It may interest feminine readers to know that the copyright of the *Ladies' Field* costumes designs illustrated in our last issue is held by Mr. H. A. Beal, of 287, Regent Street, W.

**Ford Tales.**

The number of Ford yarns which have been sent in reply to the paragraph in the last issue is amazing. A great many of the jokes, however, have been repeated at least six times over. The favourite "chestnut" at present appears to be the one relating to the man who could name any make of car by the sound of the exhaust, but a revised version may be necessary for publication!

**Exclusive Contents of This Number.**

The present issue is one of exceptional interest on account of its newsy and exclusive features. In addition to giving the first illustrated report of the Gloucestershire hill-climbing expedition held last week-end, we describe and illustrate a 1917 model 4 h.p. Douglas chain-driven sidecar outfit, and further relate our experiences with it. An article of particular interest is the one giving the impressions of manufacturers' visits to the war zone. A new Italian motor cycle trailer ambulance is illustrated on page 134, and a method of combining motor cycling and motor boating is shown in attractive illustrations on pages 126 and 127. An original article appears on pages 124 and 125 entitled "Highways and Byway with Brush and Canvas." The technical side is covered by a very practical article, "Commonsense and the

Motor, and a review of recent patents. The January motor cycle import and export figures are included. In a word, an issue of absorbing interest!

**The National War Funds.**

At the week-end the principal relief funds stood as follow:

The Prince of Wales's National Relief Fund (£2,978,000 distributed) ..	£5,738,641	0	0
Fund for the Sick and Wounded ..	3,286,172	0	0
Tobacco Fund ..	98,724	0	0
The Belgian Relief Fund ..	1,311,854	0	0

**Nailsworth Ladder.**

Anent the hill-climbing exhibition in Gloucestershire last week-end, on which occasion no sidecar succeeded in making the climb, it is interesting to note that as long ago as 1913 W. H. Carson made a clean ascent with passenger on a 5-6 h.p. Excelsior big single and sidecar. On another occasion F. C. North, driving a 5-6 h.p. twin Ariel and sidecar, with a member of our staff as passenger, also succeeded in accounting for the difficult ascent. Of this pair, Carson is opposed to Sunday events in war time, and North is on Active Service in France.

**A Derbyshire Hill-climbing Performance.**

Not only in Gloucestershire but also in the Derbyshire district motor cyclists were out and about last week-end on the look out for steep hills, the hill-climbing mania usually arriving with the spring! G. W. Wilkin, the competitor who made a striking performance in the last Six Days Trials on a 2½ h.p. Levis machine, has been showing what his machine is capable of when fitted with a light sidecar attachment. Wilkin is the agent for the Levis machine in Sheffield, and advertised his hill-climb for the week-end. He succeeded in climbing Mam Nick, near Castleton, with three passengers, and also made an ascent of Sir William Hill (one of the Six Days Trials test hills) with a human freight of 48½ st.

**The Horizontal Two-stroke Engine.**

The Connaught Company's claim in the correspondence pages of our last issue has aroused interest. Who produced the first two-stroke horizontally-opposed engine, a number of which have been described and illustrated in our pages? Certainly one existed four years ago, and we have seen it. We shall refer to the subject again anon.

**The Powerplus gets to Work.**

Erwin G. Baker, who recently travelled from the United States to Australia with a view to demonstrating to Australians the speed capabilities of the Powerplus Indian, has got to work. He has already lowered the following Australian road records:

Three hours, 116 miles.

Six hours, 316 miles.

Two hundred miles, 3h. 42m.

The above were accomplished on Victorian roads, and under the auspices of the Victorian M.C.

A later Baker achievement is the covering of 1,027 miles in 21½h., which is also claimed as an Australian record. The average speed in this case equals 45.2 m.p.h.

**Proposed Trial for Service Men at Easter.**

It was resolved at a recent meeting of the Birmingham Motor Cycle Club to hold an open reliability trial for Service men and Armyleters on Easter Monday over either an out and home or a circular course in the Midlands. Entries are invited from all men likely to be able to obtain leave on that day, and application for particulars should be made to Mr. S. C. Perryman, Warwick Works, Tame Road, Witton, Birmingham.

**An Autocratic Announcement.**

The Chief Constable of Manchester recently issued warnings to the effect that a speed exceeding ten miles an hour at night will be considered as driving to the danger of the public, whether there is immediate and visible danger or not. The A.A. and M.U. fought a test case on this ridiculous announcement on January 20th, and the motorist stated that his speed was twelve miles per hour, and he accelerated for a short distance to overtake another vehicle. The charge was dismissed, thanks to the A.A. solicitor who defended.

**January Imports and Exports of Motor Cycles.**

Foreign imports of motor cycles show a decline compared with the first month of 1915, whereas British exports show a substantial increase. The Board of Trade Returns are given hereunder:

IMPORTS.			
	1914.	1915.	1916.
Number ...	183	125	15
Value ...	£6,351	£5,461	£721
Parts ...	£6,163	£10,621	£19,196
Total imports for January, 1916, £19,917.			

The striking increase in the value of parts imported as well as exported will be noted.

EXPORTS.			
	1914.	1915.	1916.
Number ...	1,432	670	836
Value ...	£62,838	£29,354	£39,463
Parts ...	£20,754	£16,342	£31,602
Total exports for January, 1916, £70,065.			

UP MAM NICK, NEAR CASTLETON.

G. W. Wilkin making the ascent on a 2½ h.p. Levis sidecar with three passengers. He also climbed Sir William Hill with the same load.

# A MANUFACTURER'S VISIT TO THE FRONT.

## An Interview with Mr. B. Marians.

**M**R. MARIANS, the managing director of Messrs. Phelon and Moore, Ltd., is one of the manufacturers of Government motor cycles who have been privileged to pay a visit to the British Army in Flanders. Mr. Marians and his party called at all the important air depots and at some of the outlying squadrons, so close to the firing line that the flashes of the guns could be seen, and finally ended up by a visit to Headquarters. Various consultations were held as to the improvements desirable to the machines, and also the question of the organisation of spares was gone into, which is a very difficult matter, as each squadron is an independent unit.

In the course of his wanderings, he met Capt. A. E. Davidson, D.S.C., who promptly offered him a ride on his own machine. Mr. Marians was not garbed for the purpose, but expressed his willingness. This is an old joke of the gallant captain, who asks every motor cycle manufacturer if he would care for a ride on one of his own mounts, with the result that the said manufacturer's face falls with the rapidity of a barometer foretelling a cyclone!

Everywhere near the Front the mud was appalling. Mr. Marians told us it was like living in a ploughed field in winter time. He was pleased to be able to report that P. and M. machines were doing extremely well. Trouble was expected with such details as mudguard clearances and rims, but there was no trouble as regards the former detail and very little with the latter. The only improvements really found to be necessary are a simplification of the design of the spring forks. The bottom portion in future will consist of plain shackles fitted with large bearings and greasers, otherwise the P. and M. machines will be practically the same as in 1914. Numerous sidecars are being used by the R.F.C. They are of the Mills-Fulford corvette type, and all are attached to single-cylinder machines, so as to avoid complication in the supply of spare parts.

### Spare Sprockets Wanted.

The question of gearing was interesting. The machines are fitted with standard gears, but Mr. Marians found that those who had long distances to go want high gears, and those who have to go forward

with the batteries want low gears. Here, again, the question of spare parts precludes any alteration in the gear ratios. Asked as to the effect the war was having on the design of motor cycles, Mr. Marians said that the motor bicycle was undoubtedly being developed, and for special conditions was being made heavier and stronger. Thanks, however, to the chain transmission being entirely enclosed no trouble whatever is experienced with chain drive. He told us we would be surprised to learn how much night riding was done, and it was quite common for a man to be called out at 1 a.m. to do a journey of eighty miles. As we have mentioned before, head lights are used, and there is a demand for still bigger lamps. The P. and M. machines employed by the Flying Corps are used for despatch riding and keeping in touch with the batteries, while the sidecars are employed for taking about officers, carrying portable wireless sets, the mails, and even sacks of coal. Mr. Marians was absent for about eight days, and said that his experiences were of the most interesting and instructive nature, and would never be forgotten for the rest of his life.

## "WE TOLD YOU SO!"

### Petrol 2/6 a Gallon!!!

**T**HREE weeks ago *The Motor Cycle*, speaking of the recent announcement by the Shell Petrol Co., and the possible shortage of fuel, stated that the "scare" heralded an increase in price. As regards a shortage, we may recall import figures published in our issue of January 20th. In 1913, a peace year, 100,853,017 gallons were imported, whereas in 1915 the total was 144,939,700. That our prophecy was correct is proved by the announcement made in the latter part of last week to the effect that Pratt's motor spirit was raised 4d. a gallon, the old prices being (I.) 2s. 2d., (II.) 2s. 1d., and (III.) 2s., as against the present inflated figures of (I.) 2s. 6d., (II.) 2s. 5d., and (III.) 2s. 4d. These prices are for England and Wales, and it is usual to add another 1d. for Scotland and Ireland.

As the moment of writing, Carless petrol is 2s. 2d. for the first grade, but by the time these lines are in print this price may have gone up to the same as Pratt's. Shell at the present moment has not gone up, but here, again, it is likely that by the time this appears in *The Motor Cycle* it, and other brands, will have come into line.

Last Monday's *Financial Times* states "The Anglo-American Oil Co. has been attacked for initiating the rise, but, as we have pointed out repeatedly, it is not a case of any combine attempting to squeeze the consumer, but merely the result of the law of supply and demand." It is pointed out that America is not suffering from the over-production of petrol, and, at the same time, the use of the self-propelled vehicle has increased

enormously in that country. Furthermore, the cost of materials has been greatly increased owing to the war (tin plates, for example, have doubled in price during the past twelve months; these, of course, are used for the manufacture of petrol tins); finally, there is a shortage in transport. Petrol is also going up in America. A year ago it was fifteen cents per American gallon; to-day it is thirty-five and a half cents, and is expected to go up to forty and even fifty cents in the future. In America, it must be remembered, there is no 6d. duty. *The Financial Times* goes on to say: "We have on several occasions dealt with the

petrol problem, and have urged the Government to enforce economy in the use of the spirit by the ordinary private consumer." This we consider to be a somewhat significant statement. It looks very much as if a still further increase in the cost of petrol would be imposed.

We recently asked Mr. T. W. Loughborough, secretary of the Auto Cycle Union, his views on the present state of affairs, and he said that he thought the price of the fuel might go up to 3s. a gallon without seriously affecting the motor cyclist, whose machine averaged something like seventy-five miles per gallon as regards consumption.

ANOTHER STEAM MOTOR CYCLE.

The long round tank attached to the top of the frame holds petrol for getting up steam, and water is carried in the square tank beneath the engine. A reverse gear is fitted, which is desirable, as the wheelbase is 6ft. 3in.! The weight is 350 lb. Needless to say, an American is responsible for this latest addition to the ranks of "lightweights," and we are indebted to our Chicago contemporary, *Motor Cycling and Bicycling*, for the illustration.

## TWO-STROKE DESIGN.

### \*MR. J. MARTIN'S REPLY TO HIS CRITICS.

I HAVE to thank the various correspondents who have taken the trouble to join in the discussion on my article, "A New Two-stroke Engine," and before replying to them individually would like to say that when writing the article, I had in mind the more recent developments in two-strokes, and my criticism was intended more for the engines having a capacity of 500 c.c. and over. As I mentioned in the beginning, it was only when you got to the bigger engines that the faults became pronounced, and this explains why there are no  $3\frac{1}{2}$  h.p. or 4 h.p. two-strokes with single cylinders and air-cooling.

Again, the terms flexibility and economical consumption of petrol are only relative terms, and what one rider would call flexibility might strike another as quite the opposite, and it is only when figures are given that one can arrive at a comparison. For instance, "Rolyat" says the two-stroke he is riding is far more flexible than any four-stroke he knows, and gives as proof the fact that it can run between six and twenty-six miles per hour without misfiring. This gives a ratio of  $4\frac{1}{3}$  to 1 between his highest and lowest speeds. Now against his figures one can take what is, perhaps, the best known four-stroke single-cylindered engine with mechanical compression release such as I proposed adopting, and that is the  $3\frac{1}{2}$  h.p. Ariel, the makers of which claim that it can be walked at three miles per hour without misfiring, this result being due to allowing part of the mixture to escape on the compression stroke. I suppose the maximum speed of this machine is not below fifty-two miles per hour, which gives a ratio of  $17\frac{1}{3}$  to 1, i.e., four times better than "Rolyat's" two-stroke, so on his own figures his engine shows up badly.

#### Ton-miles per Gallon.

As regards his petrol consumption, 120 miles per gallon is very good and is much over the usual, but as he does not give any details of his weights, etc., it is very difficult to judge. Assuming his machine weighs 140 lb. and he himself another 140 lb., then he is getting 15 ton-miles per gallon. As this stands it is not too much, for four-stroke multi-cylindered engines can do 45 ton-miles to the gallon! I admit they are car engines, but they have the essential feature of variable compression and good scavenging.

I cannot quite follow "Norman's" argument about the four-fifths air and one-fifth petrol vapour expelling the exhaust gases when the throttle is opened one-fifth. Where does the four-fifths air come from? It cannot come *via* the carburetter, unless you have an extra air inlet, and then all you get is a very weak mixture, all combined in one, and this is not what is wanted, for it only keeps the compression pressure constant. Regarding his other statement that the mixture does not become stronger if the piston has to go through another cycle before firing, he is in error, for no matter whether the mixture is fired or not, every time the piston moves up and down a certain amount of petrol vapour passes from the crank case into the cylinder.

Again, Mr. Bellingham mentions the Scott as a two-stroke which does not four-stroke, and which can run slowly. As I said, this machine stands in a class by itself. At the same time, it must be remembered that it has the advantage of water-cooling and twin-cylinders, and the number of power impulses equal that of a four-cylinder four-stroke engine, and I hardly think that its most devoted admirers can claim it has the flexibility of the latter.

#### The Necessity of Simplicity.

I can quite understand the mixed feelings of the Bordesley Engineering Co. It would not do for them to slate the new design and then admit they have patented the same idea, and yet they cannot run down the constant compression engine, for it is what they make at present. As I said in my article, as long as the engines had a small capacity things were fairly satisfactory. I quite admit, when a firm is marketing lightweight machines, simplicity and first cost are the chief considerations, and it would be an open question whether it is advisable to add extra mechanism to this class.

I am glad to notice that Mr. Hughes finds the reduced pressure in the cylinder gives a cooler engine, which is as it should be, and I admit that a reasonable amount of exhaust gas does no great harm. This cannot be avoided, but what constitutes a reasonable amount is a very debatable point—I should say 15% or 20%, but in two-strokes it must touch 75% or 80% when the throttle is in the lower settings.

#### A 1907 Invention.

The question of patents does not interest the average reader much, but the idea of passing back gas or petrol vapour from a cylinder to a transfer chamber is a pretty old one. I have a copy of a 1907 specification which covers it, so I hardly think it will stand now. I can assure the Connaught Company that the drawing which appeared with my article is over a year old, and in view of this 1907 invention, I did not think it worth patenting without other features. I went into the matter deeply a year ago and came to the conclusion that there was a constant passing of new gas from the inlet to the exhaust port over the piston. I put this loss at 10-15%, and was very much surprised to learn from an article in the *Automobile Engineer* that I had greatly under-estimated it, and that it ran up to 37%, which is really out of all reason.

The author evidently knew what he was talking about, and seemed to have no doubt about his figures. I think he got at that figure by analysis of the exhaust. The solution of this difficulty is the only thing worth patenting, and I could not explain my design in my paper, for I am still engaged in detail work.

My apologies are due to the Bordesley Co. in reference to experimental work, for I was under the impression that they were a controlled firm.

In conclusion, I should like to say that it has given me great pleasure to see the interest taken in the variable compression idea, and that my article has opened up a new source of thought for discussion.

JAMES MARTIN.

\* Mr. Martin's original article appeared in "The Motor Cycle" of January 20th, pages 46 and 47.

## Hill-climbing in Gloucestershire.

Attacks on Two Famous and at one time  
"Unclimbable" Test Hills.

Safely over the summit of Nailsworth Ladder.

Sunday competitions to ninety per cent. of motorists are unpalatable, and we have openly stated our views upon them on several different occasions. In war time in particular we must repeat our strong disapproval of them, as nothing is more likely to bring motor cycling into disrepute. The expedition described below was not arranged by "The Motor Cycle," but six separate invitations to attend reached us, and we give below the first illustrated description of the proceedings. Finally, we may express the hope that Sunday contests of the kind will not be continued.

ON Saturday evening the Plough Hotel, Cheltenham, really presented an appearance which reminded one of bygone competition days. A goodly number of motor cyclists were assembled, including a few well-known figures. They were assembled for the purpose of making an early start on Sunday morning to attempt the ascent of two famous Gloucestershire test hills, namely, Gambles Lane, also known as Rising Sun, at the top of the Cleeve Hills, Cheltenham, and Nailsworth Ladder, near Stroud. After being accustomed to the darkened streets of London or the busy manufacturing Midland towns, the sight of the streets being a blaze of arc lamps, with many illuminated flashing signs, would have led one to suppose that "peace had broken out," had it not been for the number of uniformed soldiers, including several wounded, to be seen in the brilliantly lighted streets, who served to remind one constantly of the horrid truth.

### Some of the Party.

Among those to arrive overnight were a quartette of Harley-Davidson sidecar outfits, one of which was piloted by W. Cooper, now engaged with the company, who will be remembered as the successful driver of Bradburys and Humberettes in the past. His passenger was Mr. Duncan Watson, the new London director of the Harley-Davidson depot. George Brough, of Nottingham, was also present, mounted upon a nearly new  $3\frac{1}{2}$  h.p. horizontal overhead valve twin Brough. Mr. Whiting, the Australian designer of the Whiting spring frame, was also there with his latest model fitted with a  $3\frac{1}{2}$  h.p. J.A.P. engine.

On the morrow, when about a score of riders and machines were assembled

in the hotel yard, the weather looked very threatening, although rain was not actually falling. The first move was to Rising Sun Hill, a mile or two outside Cheltenham; a start was made shortly after ten o'clock, the roads, in spite of some grease in places, being in nice condition. The hill itself, though extremely

rough, had a comparatively firm and dry surface. This hill has figured in a number of competitions in pre-war days, including the annual Colmore Cup Trial. It was at one time considered practically unclimbable, and in one or two of the earlier trials which included this hill, men with ropes were specially

W. Cooper, with Mr. Duncan Watson as passenger, approaching the steepest section of Rising Sun Hill on an 8 h.p. Harley-Davidson.

## LOOKING DOWN AND UP RISING SUN HILL.

A four-speed Whiting spring-frame machine making a good climb.

L. Newey (3 1/2 h.p. Ariel) tackling the steepest section.

stationed on the steepest portion to assist those who were so unfortunate as to fail. On the first occasion many competitors were glad of outside assistance. Of course, in all the official trials which included this hill, it was necessary to climb it with hot engines on the run. The difference that a hot engine makes is clearly demonstrated by the fact that on the present trip only two riders failed to make clean climbs of this 1 in 4 1/2 gradient at their first attempt.

## On Gambles Lane or Rising Sun.

The following were the performances on Rising Sun. The first two machines up were the 3 1/2 h.p. Ariel sidecars, driven by L. Newey and F. Neale, which came up in close order with their passengers sitting on the carriers. Newey made a

steady, clean ascent on his 15 to 1 gear, but his *confrère* was less lucky, as on striking the rough surface near the top the sidecar wheel lifted, and the machine came to rest in the ditch. At the second attempt, however, he made a clean ascent.

Watson (5-6 h.p. twin Ariel sc.) got up well, but with none too much in hand. W. Cooper was handling a brand new outfit; he had as passenger Mr. Duncan Watson. This mount, which was unpacked on Saturday morning, and, of course, had had no chance of being properly run in, accomplished one of the fastest climbs. The electrical model ridden by Mr. Henderson was very slow in comparison. Mr. Whiting came up very steadily, apparently on the second speed of his Jardine four-speed gear box, the

lowest ratio of which was 20 to 1. The good springing of the machine was noticeable on the rough surface near the top.

## A Fine Ascent.

A 2 1/2 h.p. New Imperial-Jap, ridden by E. Arch, was one of the unfortunates, and stopped within a few yards of the top, whilst the other New Imperial, ridden by Hardwright, got up comfortably. Undoubtedly the finest solo attempt was that of George Brough, who came up at a tremendous speed, and had to cut out several times; in spite of the rough surface Brough looked quite happy as usual. A similar machine, ridden by a private owner, came up very steadily.

A little O.K. showed up conspicuously,

## SCENES ON NAILSWORTH LADDER.

The spring-frame Whiting on the steepest section.  
This machine has a Jardine four-speed gear.

George Brough, who, as usual, made a star ascent on a 3 1/2 h.p. Brough. He is seen just recovering from a big skid.

W. W. Moore, on the new chain-driven 4 h.p. Douglas model described on page 133 of this issue, passing a stranded sidecar outfit on the steepest portion of Nailsworth Ladder. The gradient here is as much as 1 in 2 $\frac{1}{2}$ .

climbing steadily and surely with power in reserve. At about eleven o'clock a start was made for Nailsworth Ladder via Stroud. After the party had passed through Cheltenham rain began to fall, and the wet roads with a strong head wind combined to render the going both heavy and unpleasant.

#### The Performances on Nailsworth Ladder.

The Ladder is a formidable ascent rising out of Nailsworth village. The commencement is the "W" main road to Cirencester, but the *pièce de résistance* is a lane leading out of the main road at right angles with a gradient commencing at about 1 in 4; after a few yards this eases off, and a narrow lane with a good surface and a moderate gradient continues for some distance, till, on rounding a right-hand bend, one

is confronted with a rise which has a reputed gradient in places of 1 in 2 $\frac{1}{2}$ . The surface, although not loose, is extraordinarily rough, and has deep ruts in it. This steep portion continues in two sections, with a comparatively easier intermediate stretch of 100 yards, the total length of the lane from the steep main road being about 500 yards.

When the competitors arrived, the surface was already tacky, but before the first attempt was made rain came down heavily, and the none too good surface was rendered very bad indeed. Curiously enough, however, the failures frequently were not due directly to wheel spin. Of the sidecars, not one succeeded in making a clean ascent, though several plucky attempts were made. Of the solo riders, only two, viz., the irrepressible George Brough

and W. Cooper (who had detached his sidecar), succeeded in accomplishing the climb at the first attempt. Both these riders came up splendidly, steering a perfect course compared with the other riders. Neither, too, took his feet from the rests, despite the roughness of the road. The curious part of the climb is that these two machines were those with the highest gears. Brough's  $3\frac{1}{2}$  h.p. horizontal twin had a low gear as high as 8 to 1 (the writer checked this), while Cooper's Harley-Davidson was geared roughly 12 to 1, which with 28in. wheels equals a gear of 11.1 with 26in. wheels. Two other clean ascents at subsequent attempts have to be recorded, viz., by W. W. Moore on the experimental model all-chain drive 4 h.p. Douglas, described on another page of this issue. Moore's first climb was a most spectacular one, as he attempted to take the hill fast, with the result that he skidded all over the track, finally striking a large bank, which threw him high into the air and caused a fall.

#### Other Good Attempts.

The other clean ascent was made by Goodacre, also on a 4 h.p. Douglas, whose first two attempts were abortive owing to falls within a few yards of the top. He was not the only one to come to grief. Mr. Whiting was unable to make a clean ascent, in spite of his 20 to 1 gear, and, curiously enough, his best climb was when he used his third speed throughout. Wheel slip no doubt had something to do with this. Newey ( $3\frac{1}{2}$  h.p. Ariel sc.) made several plucky attempts, but was unable to get up without assistance. Watson (5-6 h.p. Ariel sc.) came up slowly with passenger on carrier, but, owing to front wheel skidding, he charged the bank and stopped. Cooper also made an attempt with sidecar and passenger, but failed owing to his high gear ratio. This hill proved a distinct triumph for the horizontally opposed twin. Three out of four clean ascents were achieved by this type of machine, which rather suggested the improved stability of this even firing twin.

It rained heavily the whole time the competitors were trying the hill. Among the lookers on were Mr. W. W. Douglas and Mr. S. L. Bailey.

SOME OF THE LESS FORTUNATE COMPETITORS WHO DID NOT GET UP THE HILL!

## LETTERS TO

## THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

## Decarbonisation.

Sir,—The correspondence that has taken place lately in *The Motor Cycle* regarding decarbonisation has given me rather a shock. Either I have been extraordinarily lucky, or else I am a sinner almost beyond pardon. Let me give my own experience with a 5-6 h.p. Ariel which I purchased in June, 1914. I have run this with a tandem Canoelet sidecar, and this forms a fairly heavy combination. My human load is usually at least thirty-one stone. I weigh thirteen and a half stone myself. At the New Year holidays this year I took off the cylinders for the first time since I bought it, although the engine was still running perfectly, having at that date completed over 5,000 miles. There was very little carbonised matter either on the top of the piston or in the head of the cylinder, while the piston rings were polished like silver, and were perfectly free in their grooves. Evidently I could have done many more hundreds of miles before decarbonisation was necessary.

I may say that I use neither Oilclag nor any cooling device, while, unlike Mr. Cohen, I cannot say that I can hold my bare hand on the cylinder when running. I use Huile de Luxe alone for oiling, and as I was entirely a novice when I bought the machine, I cannot claim that expert oiling has had any of the credit. A. S. ROBERTSON.

## Two-stroke Design.

Sir,—There are two points in the letter from Messrs. the Bordesley Engineering Co., Ltd., in last week's issue of *The Motor Cycle* to which we should like to reply.

Firstly, as far back as early 1914, our Mr. Newey made an experimental Levis engine equipped with a device which, though slightly different in construction, was identical in principle with that described by Mr. Martin in your issue of January 20th.

Secondly, while we admit that the Connaught horizontal twin was the first engine of this kind of which particulars were published in the press, this is not at all conclusive, and does not entitle its producers to designate it as "the signal for others to follow." The Levis horizontal twin was a practical proposition and was receiving exhaustive tests long before any particulars of the Connaught were published.

We may, perhaps, be pardoned for the suggestion that the Connaught horizontal twin was (shall we say?) premature. Nothing further than a press notice seems to have materialised, and the firm's latest V twin two engine machine is of totally different and rather extraordinarily novel design.

We need hardly say that the Levis horizontal twin is a proved success. The article on page 110 of the same issue of *The Motor Cycle* speaks for itself.

BUTTERFIELDS, LTD.

Sir,—I read with interest the article by Mr. J. Martin on the design for a two-stroke engine which appeared in your last issue. I have been much interested in the various faults of the engines of two-stroke lightweights for a considerable time now, and I hope you will allow me space in your valuable paper to explain a design which has occurred to me.

The chief cause of trouble in two-strokes is bad scavenging and the mixing of the incoming gas with the exhaust gases. To remedy this, why not do away with the carburettor altogether and draw pure air into the crank case instead of a mixture of petrol and air? Substitute for the carburettor a small force pump, and spray petrol into the cylinder from a small jet just as the piston is nearing the top of its stroke.

The air to form a mixture with this petrol would, of course, have been admitted from the crank case, just as the mixture is on the present type of two-stroke.

A variable compression could be arranged on the lines of Mr. Martin's design by a small mechanically operated release valve with a range of openings, say, from full to half compression, only it would not be necessary for the air to return to the crank case. Of course the release valve would need to close before the petrol was sprayed into the cylinder, but this could be arranged by properly timing the cams on the crankshaft.

To vary the supply of petrol and the opening of the release valve, the actuating levers from the cams would be mounted on eccentric bushes, which, on being rotated, would cause the levers to fall away from, or drop nearer to, the cams, thus altering the lift of the valve, or the stroke of the pump, as the case may be.

The eccentrics would be controlled by Bowden wires, as in the case of a carburettor, the release valve corresponding to the extra air, and the pump to the throttle.

R. DUNSMORE.

Sir,—I beg to take exception to a point Mr. Martin raises in his article on two-stroke engines, viz., lack of flexibility. I am at present running a 2½ h.p. Villiers, and I find it more flexible than any four-stroke of equal power.

I think Mr. Martin is on the right track, and I give you herewith a description of an engine which I designed some years ago, although I never completed the engine.

\* Two-stroke engine designed by the writer of accompanying letter.

The inlet ports are a series of small holes of suitable area, slightly countersunk on either side, and are uncovered by the piston in the usual way. The main feature of the engine is the exhaust valve in the head of the cylinder, which is operated by a cam on the main shaft. The design called for a back pressure valve between the crank case and the carburettor, but this could be dispensed with as in a three-port engine.

I may say that I altered an old Fairbanks single-cylinder engine, and, although the conversion was carried out with scrap material mostly, the result was highly satisfactory. The above engine, I should add, was run at a constant speed of 850 r.p.m. It originally ran at 600 to 650, and went up 200 on the conversion, no alteration being made to the propeller, and the fuel consumption comparing very favourably with a four-stroke of reputable make. As you may readily understand, the exhaust valve gave some trouble through overheating.

TWO-STROKE.

### A Mudguarding Improvement.

Sir,—I herewith enclose you sketch of a very successful front mudguard attachment, which I have made for my machine out of an old biscuit tin at a total cost of 1s. 2d. My machine was very dirty in the matter of mud, but this attachment now allows me to run through any quantity of loose grease and dirt, and emerge with a clean appearance.

The sketch may explain itself. The bottom piece is a linoleum flange (costing 5½d.), attached to the 6in. strip of tin by copper wire (stitched). This 6in. strip has no joint in it, merely four right-angle bends. Soldered to this are the side flaps. I attached the contrivance by four bolts to the wings of my present mudguard; there is no rattle. I must add that the whole took a

beautiful black surface (including the linoleum, strange to say) from a small tin of Stovo (2½d.). With three coats the attachment looks like part of the makers' work.

FRED ROBERTS (Sec.-Lt.).

### Winnats Pass.

Sir,—I was interested in your photographs and article on climbing Winnats Pass, near Buxton, in Derbyshire, published in *The Motor Cycle* of January 27th.

For an 8 h.p. twin and sidecar to climb this hill is in no way a remarkable performance. I, with sixteen other despatch riders, was stationed at Buxton during the winter of 1914. We were mounted on Rudgets, Douglasses, and Zeniths, and climbed this hill on numerous occasions, and I think this a creditable performance for a Douglas. On some occasions the road, or perhaps I may say track, was frozen and covered two to three inches deep in snow.

I believe the pass is named Winnats Pass on account of the tremendous wind which blows down between the hills, and the climbing of the pass depends entirely on the wind. There are days when even the 8 h.p. Harley-Davidson would never climb it. I have myself been blown right off the track, machine and all, as soon as I turned the bottom corner.

J. B. BLAKEWAY, Cpl., R.E. Signals, B.E.F.

### Horse-power Formulæ.

Sir,—I am a constant reader of your valuable paper, but have so far not attempted to break into print. I am writing with regard to your interesting article, "Engine and Clutch Efficiency Test," which appeared some time ago. In this the pulling power and therefore the h.p. of the engine is measured. What I have never seen discussed in your paper is the relation of h.p. to throttle openings. Take a motor cycle rated at 5 h.p., which the manufacturers will probably tell one develops 10 h.p. on the bench test; revolutions usually not stated, but presumably about 2,500. This machine ridden solo will require a quarter to one-third throttle opening to attain thirty miles per hour on the level. If a sidecar is attached it will require about two-thirds opening to attain the same speed. Will not the h.p. developed be greater in the latter case than in the former, due to greater load and especially greater wind resistance?

If one used the formula  $\frac{D^2 \times S \times N \times (r.p.m.)}{200,000}$  (where D and S are in cms.), which I believe appeared in your paper, as a fairly accurate formula for calculating h.p. developed, the h.p. found will be the same in each case, as the formula is based on revolutions alone. This, of course, is impossible. Now what I think would be very interesting would be an article in your paper on this subject, showing how the friction and wind resistance of a sidecar machine at different speeds could be found, and from this the real h.p. developed could easily be ascertained. At higher speeds the wind resistance seems to be the chief retarding force, weight not mattering much on the level. How does wind resistance vary with the speed?

I hope that this letter will promote discussion in your correspondence columns, if you are good enough to publish it, as I would like to get a little light on the matter, having

so far found it impossible to know what the h.p. of my engine really is under various speeds and loads. H.P. [The formula which our correspondent quotes, commonly known as the Dendy-Marshall, is not intended to give the horse power actually being exerted at any and every road speed under varying conditions, but it is intended to indicate with a fair degree of accuracy the utmost horse power of which the engine is capable at different engine speeds, of course at full throttle. It is quite obvious that greater power is required to propel a machine up a steep hill at thirty miles per hour than to attain the same speed on the level where the weight has but little influence on the tractive effort. Road resistance may equal about 60 lb. per ton, therefore the weight of an extra passenger will mean that only about 4 lb. extra pull is required. Wind resistance, which varies as the square of the speed, while the h.p. required to overcome it varies as the cube of the speed, becomes a very powerful retarding force at high speeds. The 5 h.p. machine, referred to by our correspondent, running at thirty miles per hour on quarter throttle, would be exerting about 2 h.p., assuming the machine and rider to weigh, say, 360 lb. The same machine ascending a hill of 1 in 9, where possibly full throttle or nearly would be required at the same speed, would exert just over 5 h.p.—Ed.]

### A Prolific Cause of Engine Trouble especially in Two-stroke Engines.

Sir,—Having had reason to investigate some engine damage "due" (as every motor man is convinced) "to bad oil," your readers may be interested in the real cause. This has turned out in some cases to be due to the "petrol" method of lubrication, and in others to the mixing of heavier spirits and kerosenes with the petrol used. Both resulted in the same thing, viz.: gross dilution of the lubricating oil with the heavier constituents of the fuel. The oil was in each case reduced to a worthlessly thin compound incapable of standing either main bearing or connecting rod pressures, with the consequent result of worn big ends, knockings likened to a gang of riveters at work, dryness of pistons at the top end, and occasionally copious smoke from the exhaust.

In the case of "petrol" lubrication the petrol is not always all vaporised, the oil spray which wets the walls is thin and works down into the crank case. In the case of heavy fuel, unless special precaution is taken, or the inlet is sufficiently hot, a fractionation takes place, and the heavier and less volatile oil gets to the cylinder walls, washes them pretty free from lubricant, and finally dilutes the contents of the crank case. This is no fancy picture, as the amount of dilution of the lubricating oil has been found to be anything from 5% to 50%.

Another source of dilution of lubricant is the power a heavy oil has of absorbing and condensing some of the vapour and most of the spray taken into the crank case for compression on a two-stroke engine. It would be interesting if some of the possessors of knocking two-strokes would have the condition of the contents of the crank case investigated at the time of the trouble. OLEOFIEND.

### PUBLISHERS' ANNOUNCEMENT.

#### The Restricted Supply of Paper.

In view of the decision of the Government to limit the import of material for the manufacture of paper it is imperative that every possible step should be taken to avoid waste of paper in any form.

It has been the custom in the past for newsagents to order a certain number of papers for chance sales, and these copies if unsold become what are known as "returns"; in other words, waste copies.

In the case of "THE MOTOR CYCLE" the percentage of returned unsold copies has been remarkably low, but in order to conserve the supply of paper in future it is desirable that the waste of copies, ordered to accommodate occasional purchasers, shall as far as possible be eliminated.

Readers of "THE MOTOR CYCLE" are urgently requested to assist in this matter by always buying their copies from the same place, if possible, or by giving a definite order to a newsagent for the regular supply of the journal each week.

# COMMONSENSE ABOUT THE MOTOR.

IN the following article I do not propose to describe a complete motor cycle, or even to indicate a complete power unit, but only to show how many parts may be made of more suitable materials, and of a better shape for the duties they have to perform. The advantages of good design are most apparent in two of its results—long wear of each individual part without renewal (economy), and a reserve of power which may not often be required, but is to be drawn upon when unfavourable conditions call for it. This induces confidence and, therefore, enjoyment.

Power mainly depends on two principal factors—capacity and revolutions per minute. The former is decided once and for all by the maker, and is limited

by the necessity of keeping the weight (and size) of the complete machine down to a reasonable amount. The latter factor can only be obtained by scientific design from first principles, of every integral part of the proposed machine, and then the skilful combination of the separate parts, with the least amount of compromise that is humanly possible, into a harmonious whole.

When this is done conscientiously, and with entire disregard for precedent, I venture to prophesy that the result will be a revolution in motor cycle practice far greater than

has hitherto taken place from its first conception.

In my last article I mentioned some of the more obvious faults in the design of various parts of the present day machine, and I now propose to suggest improvements in their design.

## Piston.

The piston is the most violently accelerated unit in the whole mechanism, and in consequence it is the most important part to lighten—not principally to obtain extra revolutions, as most writers plausibly, but erroneously, state, for the most massive piston can be balanced in the way adopted by the A.B.C., Douglas, etc., but to avoid unnecessary strain on bearings, connecting rod, and crank. As steel is probably the only material that will stand the high temperature and retain a sufficient portion of its strength, the piston should be made of it. I give a rough sketch of a working idea. It is in two pieces of rolled steel (not cast) riveted together. The hardened steel bushes for the gudgeon pin to work in are press fits in lugs welded to the piston skirt. I propose to use a steel cylinder, so if it should be found

that the steel faces of both cylinder and piston do not work together perfectly, a couple of iron bearing rings may be fitted on to the sides of the piston, and the top one, being wider than the other, may have a groove turned in it to hold the single ring, which should be sufficient to hold compression. In the event, however, of the steel to steel modifications being satisfactory, with the help of the special lubricating system I shall describe, the above complication may be dispensed with. The amount of bearing surface necessary on the side of the piston will also repay study. The amount given to standard pistons is certainly more than adequate. The gudgeon pin should be very large in diameter, even one-third of the piston diameter is not too much. It should be bored slightly taper from each end, so as to make it rather thicker in substance in the centre where it has to be fastened to the connecting rod.

## Connecting Rod.

This is subjected to a successive pulling, pushing, and bending force. What is the best known shape to resist this force? Undoubtedly a tube which has an elliptical cross-section whose major axis is parallel to the plane of the flywheel. The rod should be as short as possible, with due regard for side pressure on the cylinder walls. Here we have to take into account the amount of offset, if any, and that especially interesting problem, the stroke-bore ratio, which, however, is far too complex to discuss in a short article. It, however, must be decided upon before the design can be proceeded with. For numerous reasons I prefer a bore which is roughly one and a

Oval hollow connecting rod with split small end.

half times the stroke, which among other advantages, gives a short connecting rod and not much side strain. An offset of approximately one-sixth of the stroke will equalise the pressure on the front and back of the cylinder, and conduce to long life.

## Bearings.

A roller bearing is indispensable for the big end, as it is the most important in the engine, and takes more than twice the strain on each main bearing. It is most important that the little end bearing should be in the piston and not in the connecting rod. Here, for instance, are some of the reasons: (1.) It can be oiled from the cylinder walls. (2.) There is much more space for a long bearing (most important, as it undergoes only partial rotation, and practically wears only one side of the pin). (3.) No driving fit is

**Commonsense About the Motor.—**

required in the piston to keep the ends of the pin from scoring the cylinder walls, also distortion of the piston is avoided. (4.) It can be easily removed without the aid of punches or presses. The main bearings are in a rather inconvenient position to lubricate by splash, so roller bearings should be used instead of plain bushes. These bearings should also be provided with compression spring washers as in the Scott.

**Crankshaft.**

This should be made as sturdy as possible. No disadvantage can accrue from rigidity, and all parts of it can be balanced. Two joints would be advisable to facilitate fitting the big end bearings.

**Crank Case.**

This is one of the few parts of the power unit, which, being a framework, can be properly constructed of cast iron. This need not weigh any more than the usual one of aluminium, for owing to the outside fly-wheel, it may be made considerably smaller. It would have no tendency to strip any threads formed in it, which may so easily happen in aluminium.

**Cylinder.**

This should be made of plain steel tubing, with a separate combustion head of cast iron, held down with long bolts. A cast aluminium casing, with very deep fins for radiating the heat away, should be shrunk on to the cylinder, which after repeated heatings is lapped to size, to prevent subsequent distortion. These aluminium fins should not have parallel sides, but should be thicker at the base than the tip. More aluminium fins could be securely fastened with good metallic contact to small machined fins on the combustion head.

Aluminium casing with deep fins shrunk on to cylinder.

**Valves.**

For valves I have in mind a modification of the De Lissa type, two-seated and balanced, but using *both* seats for the passage of gas. They are hollow and have a complete air way through the centre. The valve stem is central, and passes through two plates in the valve, one near the middle and one at the top. These are pierced with several holes to facilitate cooling. The valve stem acts as a guide to the valve, and is supported at each end. The spring is adjustable in tension, and bears directly on the top plate of the valve. These valves are placed at the top of the combustion chamber, and work horizontally. The camshaft should be placed as near the valves as possible, and directly geared by an enclosed chain. The cams, which are of the external type, should be very large in diameter, so that a sudden lift may be given to the valves without causing an undue strain on the tappet mechanism. Tappet fingers are employed to bear upon the cams with large rollers to eliminate friction, and very small and light adjustable tappets should be fitted to regulate the clearance. The gear box, holding the cams, being separate from the

crank case, could be lubricated with a suitable oil, which is at present not possible. For T.T. and racing engines the cams could be made with a double face, so that the valves are mechanically closed, a stout buffer spring being interposed to avoid damage to seats, etc. With this type of valve the available area of opening could be easily made equal to one-half the area of piston without using freak proportions.

**A Specification.**

For the whole engine I suggest that the following specification would be well-nigh perfect: Twin opposed cylinders, offset (perfect balance and even firing periods); magneto, with control on driving-shaft (maximum spark at all positions

Double-seated exhaust valve, showing bridge at top permitting ingress of air.

of advance); two plugs at least in each cylinder. There is no extra expense, and improved results are obtained at high revolutions. Lubrication as follows: Forced feed, with visible drip from a sump to both sides of cylinder walls, with entries so placed that the little end bearings get a copious supply. The waste oil from the cylinders drains into a large trough at the bottom of the crank case, from which the big ends splash it into the main bearings, becoming lubricated themselves whilst doing so. The oil is kept at a constant level by means of overflow holes, which drain it into the sump again. The carburetter, in addition to a throttle, has the more important adjustments of jet and choke tube, all three controlled from the handle-bars. The exhaust pipes should be rather long and without any pronounced bends. The silencer (one is sufficient) should be at the extremities of the exhaust pipes, and create very little back pressure. With the scavenging action of the long pipes a modified timing may be used to advantage. The flywheel is outside, and of large diameter and symmetrical section, built of steel, and with most of its mass concentrated in the rim. It should be capable of standing the most violent acceleration and the highest revolutions without any fear of fracture. A large non-return valve should be fitted to the crank case. This would minimise the loss of power due to pumping the air in and out, and ensure that no oil leaks through joints or bearings.

Features of the complete machine—first and most important, the frame must be quite rigid, both vertically and laterally. This means that the frame must be double from the back hub to the head, also every tube must be perfectly straight, and as far as possible the frame must be triangulated. The engine should not be allowed to form a connecting link in the frame. Both wheels must be sprung. The front wheel should be able to take any shocks in the plane of progression; the back wheel is only trailed when

**Commonsense About the Motor.—**

the vehicle is moving, so that a simple up and down movement would suffice. I have a great *penchant* for an infinitely variable gear, together with shaft drive. This could be made possible by means of a friction device, giving gears whose ratio is at least 1—6. The shaft drive should incorporate a spring drive, as a slipping clutch device wastes power. The shaft itself could be deeply fluted, or a spring connection could be inserted. This would be the better way, as the up and down movement of the back wheel

would be allowed for. The saddle should be very low and brought well forward. The handle-bars should be fairly wide, the steering column bisecting the straight line joining the grips.

I could say a great deal more about weather-proof fittings, control levers, tank capacity, steering rake, point of road contact, etc., but this article would be drawn out to an unreasonable length, so I will trust the assiduous reader of "Ixon's" weekly causerie to supply mentally the necessary refinements.

A. WORSDALE.

## Common Queries and their Solution.

**W**E offer no apologies to our readers for giving prominence to answers to some of the queries most frequently received at this office.

### The Local Taxation Licence (£1).

This is not transferable. It enables a man to keep one motor bicycle from the time the licence is taken out until December 31st of that year. If a man sells his first mount and purchases a second one the same local taxation licence will do. After October 1st it may be had for half fees, *i.e.*, 10s.

Sidecarriers used and adapted for trade purposes and on which the owner's name and address are painted in letters not less than one inch in height are exempt, but if the carrier be at any time removed and the machine used privately the owner becomes at once liable for the tax.

A machine permanently laid up for one year does not need to have a licence taken out in respect of it; if used on any single occasion the licence duty must be paid.

### How to Time an Engine.

**FOUR-STROKE. VALVES.**—Set the exhaust valve to close just after the completion of the exhaust stroke. It will then commence to open when the piston is about one-seventh of the length of the stroke from the bottom of the firing stroke. The inlet should commence to open as the exhaust closes and remain open for one complete stroke of the piston or while the flywheels turn through 180°.

**MAGNETO.**—Place the piston exactly on the top of the compression stroke and connect up the magneto with the points just about to break and the ignition lever two-thirds retarded. This will mean that the explosion when ignition is fully retarded will take place when the piston has travelled about 1.5 mm. down the firing stroke.

**TWO-STROKE. MAGNETO.**—Place the piston on the top of the compression stroke and connect up the magneto with the points just broken and the ignition lever fully retarded.

### A Cut-out Magneto Switch.

A magneto switch is not injurious to the magneto as some readers

seem to suppose. To connect it up, it is only necessary to bring a wire from a handle-bar switch to a terminal on the magneto contact breaker. If the contact breaker is not provided with a switch terminal, one should be purchased which is so fitted.

**WHICH WHEEL OF A THREE OR FOUR-WHEELED VEHICLE HAS A TENDENCY TO LIFT WHEN TURNING A CORNER?**—The answer is: The inside one.

### Sparking Plugs.

Some readers seem to suppose that a single-point plug is only suitable for a single-cylinder engine. This is not so; they are suitable for any type of engine.

Single-point plugs are becoming increasingly popular for two-strokes, especially for those of the air-cooled variety. This is due to the fact that the electrodes are usually much more substantial, and so are not so liable to become incandescent and cause pre-ignition. The spark occurring always at the same point tends to keep the electrodes free from oil. Multi-point plugs do not spark simultaneously at each point; the spark jumps one gap at a time, *viz.*, the one offering least resistance.

SIDECAR RUNS FOR WOUNDED SOLDIERS.

Nurse Bengé, a very popular army massage nurse at Maidstone, takes a convalescent soldier for a run on her New Hudson. The outfit of the same make in the rear is doing similarly good work, and is driven by Mr. Jordan, of the Maidstone Volunteer Training Corps.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### Timing a Two-stroke.

?

I have a  $2\frac{1}{2}$  h.p. two-stroke machine, and I have broken the magneto chain. Will you please let me know the correct method of timing the magneto. Shall I have to fit the chain before or after timing?—B.R.H.

You will probably find that the sprocket on the magneto is held in position by a nut, the sprocket fitting on the end of the cone-shaped spindle by friction. Put the chain on the sprocket, undo the nut, and have the sprocket loose on the end of the shaft. You had better get someone to stand on the other side of the machine and watch the magneto points. Make sure that the piston is at the top of the stroke, fully retard the spark, and have the contact breaker placed in such a position that the points have just broken. Then lock the sprocket in position.

### Removing Tar Stains.

?

(1.) How can I remove tar, picked up from a freshly repaired road, from a coachbuilt sidecar without damaging the paint? (2.) Will the same method apply to black enamel? (3.) After a fast run of from fifty to sixty miles my back tyre, rim, pulley (near side only), and belt were smothered in grease, which appears to have leaked through somewhere between pulley and chain case, but how it got on the rear wheel rim, unless carried along the belt and then thrown off, I do not quite understand. I oiled fairly frequently to be on the right side. I should naturally like to cure this. Do you suppose I gave too much oil? (4.) Would painting the tyres preserve them in spite of grease? (5.) Is there anything on the market with which one can treat a motor bicycle to prevent rusting entirely?—S.L.G.C.

(1.) Tar is best attacked at once if it is on the coachwork. If left a couple of days it is difficult to remove. One of the best methods is to rub it off with a soft cloth and plenty of butter or lard. Chemico or some similar car polish may help you in this respect. This is obtainable from any motor agent. (2.) This advice also applies and is equally good for black enamel. (3.) This trouble is probably due to the bearings being slightly worn, allowing an excessive amount of oil to come out and get on the belt,

which carries it to the rear wheel. A faulty crank case release valve might also cause the oil to be blown out in this manner. (4.) Painting the tyres preserves them to a slight extent. (5.) All you can do is to smear the bright parts with grease and not clean them during the wet weather. There are several treatments of metals to prevent rust, but these have to be carried out before completion by the manufacturers. Several transparent lacquers are sold for preserving bright parts from rust.

### Fitting a Drip-feed Lubricator.

?

As a novice, I am writing to ask your advice on the following: My first mount—a 2 h.p. lightweight—is fitted with a pump, but I am desirous of having fitted an automatic or semi-automatic lubricator. (1.) Is the crank case suction sufficient for the first named, of course retaining the ordinary hand pump, or, if the semi-automatic, what type and make would you advise, efficiency and ease of operation being considered first? Should I have any difficulty in getting either fitted? (2.) What is the best plan to pursue with valve caps that refuse to be shifted? (3.) The carburetter which is fitted to my machine has no tickler for flooding the float chamber. Is this usual on lightweight carburetters of the older type? As it stands at present, it is a little difficult to get a good body of petrol into the float chamber quickly enough to ensure an easy start. The position of the usual tickler is covered by a cap. Could I have one fitted?—NOVICE.

(1.) Many of these lubricators are intended to work through crank case suction; there should be no difficulty in having one of them fitted. (2.) The best plan is to put a large spanner on to the valve cap, having first soaked this in paraffin overnight, and give it a few sharp taps with a hammer. Very few valve caps will resist this treatment, especially if the engine is run for a few seconds just to warm up the cylinder. (3.) In this case the best plan is to take the needle between the finger and thumb and lift it up. This will have the effect of flooding the carburetter. Of course, the cap has first of all to be removed. It is hardly necessary to have a float agitator fitted.

### Difficult Starting.

?

(1.) My 6 h.p. twin sidecar gives me a deal of trouble in starting, though I apparently follow the instructions issued by the company. (2.) What is the cause of so much backfiring when starting in free engine? The machine suffered serious damage through the carburetter catching alight on the occasion of a backfire. (3.) Is there an electrical starter on the market for motor cycles?—W.B.H.

(1.) The trouble is most likely to be due to too weak a mixture at slow speeds. Fitting a larger jet might cure the trouble. Also be sure that there are no air leaks at the carburetter or induction pipe unions. (2.) The cause of it catching fire was most probably that petrol was leaking somewhere, and was ignited when the popping back occurred. You could do a good deal by carefully examining the inlet valves and seeing that they are working freely in their guides, also that the springs are strong enough and that the valves close properly. (3.) Electric starters have been made for motor cycle engines, but were found to be too complicated to be practicable.

### Renewing a Big End.

?

(1.) I wish to renew the big end bush in my 1912  $3\frac{1}{4}$  h.p. Premier motor cycle, but I am unable to remove one of the flywheels to get at it. Are these flywheels pressed on, and can they be removed with the average tackle? Of course, it is understood that the grub screw is removed? (2.) On taking the engine down the valve side half of the crank case refused to come away from the crankshaft with the flywheels in position. Is it necessary to remove the flywheels to take this part of the crank case away?—B.B.T.

(1.) The flywheels are usually merely a driving fit on taper shafts, so there should be no difficulty in removing them by tapping the ends of the crank pin with a hammer, having previously placed a piece of brass or copper between. (2.) The valve side half of the crank case can be removed without disturbing the flywheels, but in order to do this it will be necessary for the small timing wheel to be removed. This is keyed on to the engine shaft, and has a locking screw with a left-hand thread.

**SPECIAL NOTICE.**—Copies of "The Motor Cycle" may only be sent to neutral European countries if posted direct from the offices of the publishers, or by newsgagents who have obtained permission from the War Office for this purpose. The publishers of "The Motor Cycle" have obtained the necessary permission, and, consequently, can send subscribers' copies as usual. Before sending through newsgagents it is important to enquire if permission has been obtained, as otherwise copies intended for neutral European countries will not be forwarded by the Post Office.

**Loss of Power.**

?

I should be much obliged if you could tell me what is wrong with my 1914 2½ h.p. two-stroke. On the stand it runs splendidly, two-stroking evenly at the lowest speeds. When on the road, however, it takes a long time to pick up, whatever the position of the air and throttle levers, and refuses to take the slightest hill. I am certain the timing is correct, and I have carefully made all joints with gold size and tested them. I have removed all carbon deposit and the rings are both free. The compression is not very good. I can hear a slight hissing past the rings on both the up and down stroke of the piston when turned over slowly. On disconnecting the oil pipe there is a slight escape of mixture on the crank case compression stroke from the points where the oil enters the bottom of the cylinder on the left-hand side of the machine and the bearing on the crank case behind the timing wheel, but it does not blow oil back into the drip feed when the pipe is connected. After leaving the machine for a short time I find a few drops of oil on the ground under the crank case which appears to have leaked through the main bearing on the timing wheel side, but I can trace no leakage of mixture from these. Do you think that reboring the cylinder and fitting a new piston and rings would improve matters? The release valve seating which screws into the cylinder head is stuck tight, and consequently I have to remove the cylinder to grind in the valve. What is the best way to remove the valve seating?—L.P.

The most likely cause of your trouble is faulty piston rings; it is, therefore, quite possible that the new rings properly fitted would be all that is necessary. If, however, the compression still leaks past them after they have been run in, say, 200 miles, it would probably be better to have the cylinder rebored and a new

piston fitted. To obtain good results with a two-stroke all likelihood of leakage of crank case compression, either through the crank case joints *via* a broken oil pipe or worn bearing, should be overcome. As oil drips out of your engine while standing, it is possible that the trouble is caused by leaky joints in the crank case. We should recommend you to soak the valve seating in paraffin and then attempt to remove it with a large fixed spanner when the engine is hot. If necessary, give several short, sharp taps with a hammer.

**EXPERIENCES WANTED.**

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"G.K.F." (Glasgow).—Grado multi-pulley.

"J.E.K." (Surrey).—Coventry Eagle. Consumption, general efficiency, and speed.

"J.N." (Hamilton).—4 h.p. Norton. Reliability, speed, hill-climbing, and consumption.

"F.S." (Herts.).—4 h.p. Norton and 3½ h.p. Sunbeam. Gears, flexibility, durability, speed, and petrol consumption.

"W.K.M." (Sheffield).—T.D.C. de luxe (two-speed gear). Reliability, hill-climbing, consumption, control, and ease of starting.

"H.A.B." (Coventry).—Binks carburetter for Scott. Consumption, flexibility, and acceleration. Also Binks special fuel.

**READER'S REPLY.****Noise in Engine.**

I notice under your Questions and Replies in your issue of January 20th a query initialled "D.C.B." Now, I bought a new 2½ h.p. two-stroke twelve months ago, and after running it 200 miles without any trouble, I was stranded one day three miles from home.

The engine suddenly stopped, and I could not get any spark at all, so was compelled to push the cycle home. I took it to an expert local dealer and repairer, and his solution was as follows: The sprocket wheel which drives the magneto was fastened to a tapered arm (not keyed), and had been tapped on tight after the engine had been timed; no screw could be found loose in the chain case, and he came to the conclusion that this had been missed by the makers and a screw had not been put in at all. The sprocket wheel had worked loose and the timing was disorganised. The repairer retimed the engine, but found when the machine was running a very bad grating noise and knocking occurred. His opinion was that the crankshaft had been bent through a heavy backfire when the timing went wrong, and advised me to send the machine back to the makers, as I had only had it six weeks, and their guarantee covered faulty workmanship. I took it to the makers' local depot and they forwarded it to their factory. They admitted that the crankshaft was bent, but would not admit having left the screw out of the magneto sprocket wheel. All they would say was that the trouble was caused through "faulty driving," and I would have to pay £2 5s. for the repair.—W.W.

**RECOMMENDED ROUTES.****WOOLWICH TO MARLBOROUGH.—J.S.**

Woolwich, Eltham, Catford, Forest Hill, Dulwich Common, Christchurch Road, Clapham Common, Wandsworth, Upper Richmond Road, Railway Hotel, Barnes, Mortlake, Richmond, Fulwell Park, Hounslow, Bath Road, Colnbrook, Slough, Maidenhead, Reading, Hungerford, Marlborough. Approximately 90 miles.

**SUDBURY TO ABERYSTWYTH.—C.F.H.**

Sudbury, Haverhill, Cambridge, St. Neots, Bedford, Newport Pagnell, Buckingham, Deddington, Chipping Norton, Stow-on-the-Wold, Tewkesbury, Ledbury, Hereford, Hay, Builth Wells, Rhayader, Llangurig, Dyffryn Castell, Aberystwyth. A reader recommends the route outlined above as between Ledbury and Rhayader to that given in our issue of September 9th, 1915, *i.e.*, *via* Willersey and New Radnor. The latter is preferable on the return journey.

**EVESHAM TO THE LAKE DISTRICT.—AB 3764.**

**DESPATCH RIDERS IN A JOYFUL VEIN.**

A photograph, taken on Salisbury Plain, showing R.E. despatch riders overhauling their machines and, incidentally, enjoying themselves. The men are, from left to right: Sgt. Pearson, Art.-Cpl. Badler, and Cpls. Ellis and Young.

# PATENTS.

Abridged by ERIC W. WALFORD.

## Two-stroke Engine Lubrication.

Oil is being supplied from a drip feed device by means of a tube A to an annular chamber which surrounds the cylinder wall at a point below the lower edge of the piston when the latter is at the top of the stroke. Holes are drilled in the cylinder wall to allow the oil from the chamber B to lubricate the piston, but the oil cannot flow from the tube A into the hole nearest thereto, as there is provided on the inner side of the annular chamber a wall C. The consequence is that the entering oil has first to travel the whole way round the cylinder before it can overflow this wall and pass through the holes in the cylinder wall. This ensures equal distribution of the oil. Another point is that the oil holes are exposed to the suction in the crank chamber when the piston is near the top of the stroke, so that the lubricant is sucked into the cylinder. These two features are claimed to enable drip feed lubrication to be used.—G. H. Hemingway and the Coventry Acme Motor Co., Ltd., No. 5,064, 1915.

it can overflow this wall and pass through the holes in the cylinder wall. This ensures equal distribution of the oil. Another point is that the oil holes are exposed to the suction in the crank chamber when the piston is near the top of the stroke, so that the lubricant is sucked into the cylinder. These two features are claimed to enable drip feed lubrication to be used.—G. H. Hemingway and the Coventry Acme Motor Co., Ltd., No. 5,064, 1915.

## A Twin Two-stroke Engine.

The engine illustrated has horizontally opposed cylinders, and is designed to give even firing, the chief feature of novelty being the construction of the crank chamber, whereby it is divided into two gight compartments, at the same time

affording a central bearing for the crankshaft. This shaft is formed with two distinct cranks AB, to which are connected the usual rods CD, operating in cylinders of the usual type. The crank case is formed in two halves E, of which one is shown separate in the smaller view,

and each half is formed with a web F. This web F and the side walls of the crank chamber each carry one half of a split bearing for the crankshaft, and the crank case halves are bolted together after the crankshaft is put into place. The chief merit of the opposed twin—its good balance—is lost.—W. A. L. and R. Spencer, No. 21,748, 1914

## A Two-speed Gear Box.

Upon the main shaft A are mounted spur gears B and C, the former of which is fixed upon the shaft, whilst the latter is normally free to rotate independently. Beyond the gear C the shaft is enlarged and formed with clutch dogs D. The gear wheel C has similar dogs E, whilst

on the opposite end of the shaft is a sleeve F, which is formed with long clutch dogs G, and at its outer end carries the belt pulley H. The spur gears B and C engage gears JK on a short layshaft, and the latter gears always

rotate together. Mounted around the enlarged part of the shaft A is a clutch sleeve L, formed with a groove to receive the operating lever M. The side walls of the sleeve L are formed as dog clutches, which may engage either dogs D, E, and always engage the dogs G owing to their

length. In the position shown the gear wheel C is locked to the driven sleeve E, and the drive is, therefore, through the gears B, J, K, and C, affording a gear reduction. On moving the clutch sleeve L to disengage the gear C and engage the dogs D the main shaft is coupled to the driven sleeve, and the drive is direct, the spur gears running idly. In the intermediate stage a neutral position is afforded, and the specification describes a modified arrangement in which the driving and driven elements are both arranged on the same side of the gear box.—E. Jardine, E. Watchorn, and J. Archer, No. 21,109, 1914.

## An Engine, Gear, and Clutch Unit.

Integral with the engine crank chamber casting A is a tubular extension B, which may form the housing for a simple two or three-speed gear C, and is attached by clamps to a frame tube D. The engine may be of any type desired, and its shaft is extended at E, and at its end carries a flywheel F, which may be the only flywheel or may supplement ordinary flywheels in the crank chamber. The driven spur gear of the change-speed mechanism is formed with a sleeve H, on

which are fixed a clutch plate I and a starting sprocket J. On the end plate of the gear housing is a screwed boss K, on which is mounted a sleeve L, around which is carried the belt pulley G. One flange of the belt pulley is adjacent to the clutch plate I, and one of the faces is lined with some clutch lining material. The pulley face is normally pressed up against the clutch plate by a spring arranged in the recess M, but may be withdrawn therefrom by actuating the sleeve L by means of the lever N, when a free engine effect is required. The magneto driving sprocket is shown at P. It will be seen that the whole mechanism is more or less balanced on each side of its securing clamps, and the whole unit is removable by undoing a very small number of fastenings.—H. S. Griesbach, No. 1,359, 1915.

## MOTOR CYCLES FOR SALE.

## Arno.

**SMART** Combination, 1914 3 1/2 h.p. Arno, 3-speed, cane sidecar, well upholstered, lamp, horn, Senspray; 38 gas.-Railway Garage, Staines. [9834]

## Arrow.

**1915** 4 h.p. Arrow-Jap, coachbuilt combination, 4-speed, Jardine countershaft, kick start, Bosch, Amac, Dunlop tyres, and belt, Lycett's La Grand Miller lamp, horn, mirror, etc., new August, run 60 miles, insured; 60 gas.-52, Mill Lane, Macclesfield. [9758]

## Auto-Wheels.

**UTO-WHEEL**, perfect condition; £8.-Harry's, Market Place, Romford. [9769]

**UTO-WHEEL**, B.S.A., almost new; £10.-Wauchope's, 9, Shoe Lane, London. [X1622]

**UTO-WHEEL**, run 300 miles, perfect condition; £10.-Dallyn, Landkey, Barnstaple. [X1333]

**UTO-WHEEL** de Luxe, £15/15, or 26/3 monthly; second-hand standard model, £10.-248, Bishopsgate, London. [9807]

**UTO-WHEEL**, complete, fit any cycle; cost £13, take £13; nearly new.-Oakfield, Solihull Rd., Shirley, Birmingham. [9529]

**UTO-WHEEL**, new condition, guaranteed perfect, all accessories; genuine bargain, £10, or nearest offer.-Westgate, St. George's Av., Wollstanton, Staffs. [X1062]

## Bat.

**BAT-J.A.P.**, 4 h.p., Mabon, free engine, spring frame, engine overhauled by makers; £18/10.-Sibley, 72, South St., Romford. [9767]

**BAT-J.A.P.**, 1912, 8 h.p., free engine, splendid condition, smart appearance, recently enamelled and plated; £26; genuine.-Cater, St. Cloud, Amersham. [9596]

**1915** 8 h.p. Spring Frame Bat, and spring wheel Bat sidecar, 2 luggage grids, 3-speed gear, clutch, kick starter, 2 pairs handles, new last Easter, only used weekends, exceptionally well looked after, almost pass for new, one of the smartest outfits on the road, guaranteed faultless; £75.-Hucklebridge, 133, Sloane St., S.W. [9601]

## Bradbury.

**BRADBURY** 1916 Models.-Agents, Bright and Hayles, 73, Church St., Camberwell, London. [9652]

**BRADBURY**, 4 h.p., 1912, 2-speed, etc.; £25.-Colmore Depot, 31, Colmore Row, Birmingham. [9845]

**BRADBURY**, 1913 1/2, 4 h.p., 2-speed countershaft, kick, good condition, 32 gas.; Canoelet, £6/15.-20, Beauchamp Rd., Clapham Junction. [9694]

**BRADBURY** Motor Cycle, 4 h.p., fixed gear, new wheels, tyres, undeguard, handle-bars, capital machine; £22.-John Henry Moss, 50, Ansthorpe Rd., Cross Gates, Leeds. [X1648]

**BRADBURY**, 1914, 2-speed, chain drive, and splendid sidecar, accessories, also tradesman's box to take place of body; £42/10; seen by appointment.-Bristow, 23, Bickersteth Rd., Tooting. [9609]

**BRADBURY** 1914 1/2, 6 h.p. C.B. Combination, 3-speed, countershaft, kick start, clutch, enclosed chain drive, new Druid II, spring forks, lamps, horn, new cycle car tyre, not done 2,000 miles; £60.-Heywood, 11, Library St., Wigan. [X1505]

**BRADBURY**, 1914, 6 h.p., 3-speed countershaft gear, aluminium chain cases, coachbuilt sidecar, complete combination listed new at £91, fitted with lamps and mechanical horn, new 3 in. Pedley back tyre, new Dunlop r.s. front tyre; a bargain, £51.-The Premier Motor Co., Aston Rd., Birmingham. [9854]

**1914** Rudge Multi, 3½ h.p., absolutely new condition, special machine; £38/10, genuine bargain.—Newham, 223, Hammersmith Rd., W. [X9695]

**6** h.p. Rudge Multi, fitted with roomy comfortable sidecar, complete with all accessories; £45; guaranteed.—Wauchope's, 9, Shice Lane, London. [X1617]

**RUDGE** Multi, I.O.M. T.T., August, 1915, done 1,200 miles, speedometer, and all accessories, very fast; £50.—Capt. Abell, 140, Harlaxton Rd., Grantham. [X0363]

**RUDGE**.—If you want to buy a good one let us know. If you want to sell one let us know.—Longman Bros. (Rudge Specialist), King St., Acton. 1578 Chiswick. [X9481]

**RUDGE** T.T., 3½ h.p., 1915, in practically new condition, special machine, picked engine, very fast; bargain, £37.—Elce and Co., 15-16, Bishopsgate Av., Camomile St., E.C. [X0492]

**RUDGE** Multi 1914 3½ h.p. Combination with Rudge 18 gn. sidecar, hood, screen, speedometer, lamps, etc., in excellent condition; accept 44 gns.—Longman Bros., King St., Acton. [X9683]

## MOTOR CYCLES FOR SALE.

## Rudge.

1916 Rudge Multi. 3½ h.p. roadster, £58/15; two actually in stock; Canelet sporting and model B3 sidecars, with fittings to suit, in stock.—D. J. Shepherd and Co., Enfield Highway. [X15805]

RUDGE Multi, 1913, completely overhauled, new piston and clutch fitted and re-bushed last December, appearance good, engine as new; £50; owner in Flying Corps.—Barrett, c/o Jewell's Garage, 168, Archway Rd., Highgate. [X1723]

## Russell.

11 h.p. Russell, mag., fitted 1915 countershaft 2-speed, F.E., perfect order; £10/15, bargain.—Carson, Townhead, Eym, Sheffield. [X1599]

## Scott.

1912 (late) Scott, Canelet sidecar; any trial by appointment; £40; must sell.—29, Nelson Rd., Gillingham, Kent. [X1533]

SCOTT Motor Cycle and Sidecar, 1912, in perfect condition, with all accessories; £45.—Leslie, Hetherington, Bootham Grange, York. [X1746]

SCOTT, 2-stroke, 2-speed model, fitted with comfortable sidecar, the combination complete with all accessories; £33; guaranteed.—Wachope's, 9, Shoe Lane, London. [X1613]

## Singer.

1912 3½ h.p. Singer, perfect; £20, or exchange.—Wardle, Aberford Rd., Woodlesford, Leeds. [X1576]

4 h.p. Singer (cane sidecar), 1913½, 2-speed, countershaft, clutch, lamps, horn, speedometer; £38/10.—8, Olipstone Ave., Nottingham. [X1326]

SINGER, 4½ h.p., 2-speed countershaft, coachbuilt combination, F.E.S. head, Lucas rear, separate generators, Coway, horn, new Dunlop, extra heavy on back, original tyres on front and sidecar, spares—re-treaded extra heavy tyre, new tube, valve, tools, equal to new, mileage 3,700; cost 84 gns. August, 1914, £52, or nearest.—W. A. Williams, Builder, Caergarle, N. Wales. [X1573]

## Spur.

SPUR, 3 h.p., 2-stroke, 2-speed, 1916, just delivered; 54 gns.—Chris. K. Butt, Chapel Av., Bourton, Dorset. [X1423]

## Speed King.

1914 Speed-King-Jap, 2½ h.p., 2-speed, 23 gns.; generous easy terms.—Lamb, 151, High St., Watthamstow, and 50, High Rd., Wood Green. [X1626]

## Stevens.

STEVENS, 4 h.p., B. and B., spring forks, Fisher mag., countershaft 2-speed, separate clutch, Brooks, Clincher, Michelin.—C. Jennings, Sampford Peverell, Taver-ton. [X1495]

## Sun.

SUN-VILLIERS Lightweight, shop-soiled only; £28 to clear.—Slack's Garage, Stockport. [X1453]

SUN-VILLIERS, 2½ h.p., 1915, splendid machine; £22.—Colmore Depot, 31, Colmore Row, Birmingham. [X1859]

SUN, 1916, V.T.S., 2½ h.p., 2-speed, 2-stroke, latest brand new models, in stock; £37. Tel.: 388. T.A.: Bicycles.—Robinson's Garage, Green St., Cambridge. [X1667]

SUN 2-stroke.—All models from £30/10 to £37; earliest deliveries. All motor cycles bought from us have their tanks filled, on delivery, without extra charge.—Messrs. Green Taxis, Villiers St. Garage, Charing Cross, London. [X1854]

## Sunbeam.

SUNBEAM, 1916, 3½ h.p. model, just delivered.—Dominy, Jewry St., Winchester. [X1543]

SUNBEAMS, 70 gns.; can I quote you for yours in exchange?—Bunting, Wealdstone, Harrow. [X1657]

CONSULT Rex Mundy before purchasing a new or second-hand Sunbeam.—See "Consulting Engineers" column. [X1514]

SUNBEAM, 2½ h.p., in perfect condition, lamps, horn, speedometer; £36.—E. Stoner, Aylsham, Norfolk. [X1739]

SUNBEAM, 2½ h.p., 1913, 2-speed, kick starter, good tyres; £30.—27, Woodbridge Rd., Moseley, Warwickshire. [X1672]

1914 Sunbeam 6 h.p. Combination, in splendid condition, speedometer, Lucas lamps, horn, wind screen, exhaust whistle, etc.; £80.—Best, 1, Rupert Rd., Sheffield. [X1058]

## Swift.

SWIFT, 1912, 7.9 h.p., hood, screen, speedometer, watch, horn, lamps, complete, in new condition, perfect order; any trial; bargain, £55.—Hook, 441, Brighton Rd., Croydon. [X1594]

## T.D.C.

T.D.C. de Luxe, 2-stroke, 2-speed, new.—Marshall, Castle St., Cambridge. [X1555]

1915 De Luxe T.D.C., 2-stroke, accessories; £18.—143, Evington Rd., Leicester. [X1565]

## Triumph.

1915 Triumph, 4 h.p., 3-speed, as new; £45.—A. Merrett, Corsham, Wilts. [X1678]

# The SURRIDGE

## Holdtite Lamp Dimmer

Best—Strongest—Neatest.  
No Unsightly Creases.

Made in Transparent Rubber to meet requirements of Schedule 1, giving perfect light to required regulations. A firm grip on the lamp. Waterproof.

Size.. 4in. 5in. 5½in. 6in. 7in. 8in.  
Each 2/- 2/3 2/6 2/9 3/- 3/3.

Also made to meet requirements for Schedule 2, in Opaque Rubber and the necessary holes, prices as above.

Post Free or from your Agent.

Made for Electric Lamps or to any required size on particulars sent, and with Lamps having a shade such as Motor Cycle Lamps.

# HOLDTITE.

The Patch that LOCKS the PUNCTURE.  
The Patch the Army is Using.

Ask your Agent for SURRIDGE'S PATENT HOLDTITE PATCHES. Don't be put off others are as good.

Greater results with the Patent Holdtite Patch than all other Patches combined.

Simple to use. The Patch does the work itself, NO SPECIAL SOLUTION REQUIRED.

## Sunday Events and Prohibition.

**T**HIS vexed question is once again revived by the unofficial organisation of Sunday hill-climbing expeditions referred to in our last issue. Since then we are happy to state our disapproval of Sunday events has been supported in many quarters, which, after all, is only as it should be. The sight of able-bodied men indulging in "sporting" events on Sundays, particularly in war time, cannot be commended, and we should not be surprised if the Auto Cycle Union, the governing body of motor cycling, were tempted to step in and denounce events of the kind. This is an age of prohibitions, and if the A.C.U. do not deal with the matter with a firm hand, it is quite within the bounds of possibility that the Government may go a step further and introduce a partial prohibition of private motoring. But quite apart from such a serious possibility, in the interests of the movement we must not allow motor cycling to be dragged down. It is a reflection upon the motoring community if Sunday competitions are indulged in by a small minority, who, we are perfectly ready to believe, have not paused to consider the matter from all its aspects. So far as *The Motor Cycle* is concerned, nothing will be done to assist in the organisation or support of Sunday competitions, but, as a journal publishing a complete history of the motor cycle movement, we are bound to refer to such events, much as we may object to them. Finally, we should like to make it clear that we do not for a moment suggest there is wrong in ordinary Sunday runs. Motor cyclists as a class are mostly folk of scanty leisure, and their only free time is usually at the week-ends. To deprive hard workers of a run into the fresh air of the countryside would be a foolish thing. What we deprecate is the noisy gathering collected at some hill, disturbing the peace of the day and generally turning Sunday into pandemonium by the use of freak gears and open throttles. Ask the villagers and

country residents generally what they think about it; and above all bear in mind that, numerous as we may be, we are in a minority. The non-motorists greatly outnumber the motorists, and it is only commonsense to avoid needlessly exciting the prejudices of the majority.

## Motor Taxes and the Budget.

**I**T is too early yet to talk with any degree of confidence of what the new Budget may bring forth, but there are already rumours to the effect that the tax on motor vehicles will be increased. This is surprising in view of the trials and tribulations through which the trade has already passed as the result of the entire dislocation of ordinary business channels created by the world conflict, but it is earnestly to be hoped that whatever increase is imposed, if any, it will only be tentative for the war period. After the war it will need the combined energies of politicians, business men, and engineers to regain for British trade its place in the world. Consequently any new taxation imposing hardships, which an already weakened industry is unable to bear successfully, might have very serious consequences. When the talk of increased taxes was general last October, it was confidently expected that owners of foreign-made motor vehicles would be treated on a different basis from others, but, instead, the Government in effect did owners of such vehicles a good turn, for the imposition of 33⅓% duty on future imports had the effect of raising the value of existing vehicles. As we have said, it is too early yet definitely to anticipate increases, and the Government is not likely to cripple unduly the British motor industry which has already suffered so much, and yet was able subsequently to render such valuable service to the country in the matter of munitions; but if increased taxation is to be imposed, then it is pertinent to ask whether owners of imported cars and motor cycles are to be taxed on the same basis as the more patriotic user who has kept his money in the country.

## An Unfortunate First Trip.

### SOME QUESTIONS OF PASSENGERS AND INSURANCE.

**A** CASE of some considerable interest as concerning both buyers and suppliers of motor cycles was reported in *The Motor Cycle* of the 3rd inst., where damages of £650 were awarded to a Mr. Gardner for injuries received while being driven home in a second-hand sidecar outfit he had purchased.

The first query that will probably arise in the average reader's mind will be as to whether the defendants had protected themselves with the usual proviso as to the driving of customers' cars or cycles being at customers' risk. Such a proviso, however, could not apply to cases of injury to clients who might be riding as passengers—as in the case in question—caused by negligent or wrongful acts on the part of the firm's drivers. It would not even cover cases of damage to the car, if negligence could be proved. All it reasonably can cover is unavoidable accident and the ordinary risks of the road. Nevertheless, had the

plaintiff been taking any part in driving at the time his position would have been very different, but, having relegated himself to the status of a passenger, he was protected by law, with the result already stated.

Thus one gets an important illustration of the great responsibility of a driver towards his passenger, and the illustration may well be applied to the ordinary conditions wherein a motor cyclist takes out a friend in the sidecar. He must remember that; in law, although he may be doing that friend a favour, or even an act of pure charity, in taking him out, he will be liable for damages should that friend meet with any injury which can legally be ascribed to negligence on the part of the motor cyclist. It is, therefore, important that this risk, which is so frequently incurred, should be covered by insurance, and riders of sidecar combinations should examine their policies carefully to see that they are properly covered in this respect.

#### A DERBYSHIRE MOUNTAIN PASS.

The Winnats Pass, Castleton, showing the part which the average rider can easily get to. Beyond it is very doubtful if the Pass is climbable, not owing to severity of gradient, but because of wheel slip. The Pass above this point consists of limestone rock in a fairly smooth condition, but owing to disuse the road is now covered with grass. Winnats Pass is on the opposite side of the mountain to Mam Tor.

### An Attempted Remedy.

Mr. Chas. Binks, of carburetter fame, has just brought out a new and interesting vaporiser for the babies. It is of the three-jet type, like his other carburetters, and it is fairly obvious that the multiple-jet principle should be specially beneficial for the little 'uns, as the smallest jet should ensure two-stroking at low speeds. This claim is borne out in practice, as my initial tests of the carburetter have proved; I put it on my James, and got improved starting and slow running before the best jet had been selected. This is, however, the least important of Mr. Binks's innovations. He is of opinion that few two-strokes atomise their petrol at all satisfactorily. Petrol can be vaporised by high velocity spraying or by heat. It is not easy to increase the velocity of the suction, but it is possible to apply increased heat to the gas. He began by pouring boiling water over the crank case of a Calthorpe two-stroke before starting, and found it of great value. Being a logical man, he perceived that the engine might stand increased heat even when it was warmed up. So he fitted a tin screen to fend head draughts off the crank case, and, instead of taking the carburetter air supply from the open and chilly air, he fitted a collector funnel round the silencer (the exhaust pipe or the cylinder would serve almost equally well), and coupled it to the main intake of the carburetter. The immediate results were a marked economy of fuel and improved steadiness of carburation under deceleration and acceleration. It is hardly fair of me to publish these facts, as the hot air supply and the screened crank case are experiments which any owner can make for a shilling or two; and as Mr. Binks is the first to imagine and prove their merit, he deserves more than empty kudos for his ideas. Where a long pipe has to be employed to conduct the warm air supply to the carburetter, it may be well to lag it with suitable material to keep the heat in. The disposition of the parts concerned on many machines implies a long and exposed pipe, which would be constantly chilled by head draughts. Mr. Binks ascribes the results obtained to the stoppage of condensation, due partly to the low velocity suction and partly to the inadequate temperature of the crank case. Has anybody made comparisons between the crank case temperature of four-strokes and two-strokes? I never noticed any appreciable difference, and suppose there is no danger of overheating the crank case so that an attenuated charge of mixture would be inhaled.

### Petrol Prices Investigation in U.S.A.

I know very little of the State's power of interfering with trusts and syndicates in America, but the U.S.A. appear to manage these things better than we do, to judge by a Washington *communiqué* in a New York motor cycling journal. According to this statement, the U.S.A. Department of Justice and Federal Trade Commission are making joint investigation into the recent rise in the retail price of petrol in the States

from 7d. per gallon to 10d. The grounds of their action are (1) that petrol exports were less in 1915 than in 1916, (2) that the reserve stocks in the hands of the controllers are greater than they have ever been, and (3) this last although the production for 1915 was purposely restricted for various reasons. The underlying justification of such action appears to be that the Government has a right to interfere when allied industries are hampered by an unnecessary and artificial rise in the price of a commodity, whether that rise be due to greed on the part of a combination of interests or of a single syndicate, *e.g.*, the firms controlling the supply of crude petroleum or the firms controlling refining plants, or both acting in unison. It is common knowledge that the tendency of American financiers to combine allied interests into monopolies and trusts has led to their Government taking a more active interest in prices and market rigging than European Governments have yet seen fit to do.

### And an English Defence.

I am not in a position to say that the above implications undermine in any way the defence put forward last week for British prices by a firm controlling much of the British supply. This defence dealt with factors largely extraneous to the American market, notably the cost of freight by tank steamers, the cost of distribution in England, and so forth, though the recent rise in American retail prices from 7d. to 10d. a gallon is faithfully reflected in British prices; the Shell people ask us to note that the lowest trade price for large consignments free on board at North American ports is now 10d. per gallon. If the U.S.A. Government compel a reduction in the American price it will be interesting to see if the British distributors drop their prices over here *pro rata*; they seem likely to have a chance, at any rate, of proving their *bona fides*, and we shall watch them closely. In the meantime it seems possible that amongst many industrial and commercial reforms which must follow the war some Government supervision of great monopolies may be demanded. For all practical purposes petrol is now a monopoly. It is largely controlled by closely associated concerns so far as the private user can gauge the situation, and the sole competition, until alcohol fuel is developed, arises from benzole. Even in peace time the supply of benzole was so limited in extent and so variable in quality that it exercised but the mildest influence on petrol prices; and now that the Government has commandeered the entire output of benzole for explosives the one weak modifying factor has disappeared. Such a variety of interests hinge on the price of petrol that the nation cannot afford to let any concern, however generously administered, monopolise the supplies; and the hint of Government action in the United States comes as a salutary safeguard and an inspiring example. The fact that petrol is pumped into tank steamers at American ports at 10d. per gallon, and yet costs us 2s. and

## Occasional Comments.—

upwards in this country, is an interesting sidelight on the expenses of transport, distribution, and profits. Judging by the Shell manifesto of the other week, *these expenses*, so far as Great Britain is concerned, *tot up to a minimum of 1s. 2d. per gallon*, which is astounding considering the scale on which the business is worked. If petrol cannot be cheapened we must certainly push benzole and alcohol for all they are worth. Economical motoring for the million will not stand fuel at more than 2s. per gallon.

## The Alleged World Shortage in Future.

The Shell people also offered a broad hint that the world would soon be faced with a grave shortage of petrol, unless the cracking processes of producing volatile spirit now applicable to heavy oils proved to be workable on a gigantic scale. I find the utmost difficulty in taking this statement seriously. One of my friends belongs to a romantic and little known profession. He is an oil explorer. I hear of him now from China, now from Peru; wherever he goes, he is trekking on practically virgin soil, facing the most thrilling dangers, and enduring the fiercest hardships, always in search of oil. In company, no doubt, with other men of like interests, he knows of innumerable oil fields which have never even been tapped, many of them, so far as can be judged, equal in wealth and output to those which now supply the world's markets. There are difficulties, of course: these virgin fields are not invariably situated on trunk railways, or within tram distance of great harbours; but they are workable, and the petrol market is remunerative enough, *pace* the

Shell manifesto, to justify considerable expenditure in roadmaking, pipe-laying, and the like. The Washington announcement contains no hint of a suggestion that the refiners are reducing output because the wells seem likely to become exhausted, that other wells do not exist, and that the trusts are wisely looking ahead, and saving us from the awful fate of going back to push bicycles and broughams and traps. The U.S.A. Government is evidently extremely suspicious that some of the American trusts are making hay while the sun shines. Though the noble self-restraint of certain importers is alleged to have inspired them to sell petrol to us at cost price last year, they made a seven figure profit on their total turnover. Frankly, I for one shall continue to suspend my judgment on all these excuses until more proved and solid facts are laid before me. At the moment my main feeling is that concerns which have no appreciable competition to fear, which buy millions of gallons annually in America at 10d. (I say "buy" because none of us know the exact relations between the vendors and purchasers in this instance), and which spend from 1s. 2d. to 1s. 4d. per gallon in working expenses, ought at once to reform their method and organisation.

## HILL-CLIMBING IN GLOUCESTERSHIRE.

(A fully illustrated report of this gathering, held on February 6th, appeared in our last issue.)

(Upper) 3½ h.p. horizontal twin Brough, ridden by Chidley, nearing the summit of Rising Sun Hill.

(Lower) W. Moore, on the new 4 h.p. all-chain drive Douglas, climbing the Nailsworth Ladder. The village which gives the hill its name can be seen in the valley below.

## PARAFFIN AS A FUEL.

Its Possibilities in View of the High Price of Petrol.

**Q**UESTIONS and discussions regarding the use of paraffin, neat or diluted with petrol, as a fuel for motor cycle engines appear from time to time in the pages of *The Motor Cycle*, especially when, as at present, a rise in the price of the more usual spirit has taken place. As the writer has carried out tests with paraffin over quite a considerable mileage and under varying conditions of load, country, and weather, his experiences of the use of paraffin are given herewith in the hope that other devotees of the pastime of motor cycling may have the benefit, if any is to be derived, from an enumeration of the results obtained.

Paraffin is chemically a first-cousin to petrol, both being obtained together in the crude petroleum that is the initial source of petroleum ether, motor spirit, paraffin, various lubricating oils, and finally greases, of which "vaseline" is a purified example. Power can be obtained by the combustion of any one of these several products if the practical problems of the supply and combustion of the fuel are solved by the use of correct mechanical and engineering methods. The whole trend of motor cycle engine, and especially carburetter, design has, however, been determined by the properties of the motor spirit which is generally used, a medium volatile liquid with a boiling point in the neighbourhood of 85° Centigrade, and popularly known by the name of "petrol," although, strictly speaking, this latter is a patent trade name, and should be really applied to the product of one firm only.

### Paraffin Alone.

Paraffin is so little removed in chemical and physical properties from petrol as to require little, if any, modification in most forms of carburettors. The Triumph carburetter (the old non-automatic type), in the use of which as a paraffin atomiser the writer has had most experience, requires no alteration or adjustment at all, and if the engine has been started on petrol and allowed to warm up, very little difference in the running on the level is noticeable when pure paraffin is the fuel used. Considerable knocking is, however, obtained on the slightest provocation on hills, and a prolonged climb results in real and evident overheating. Although the starting difficulty can be overcome by using a small auxiliary tank containing petrol, and a two-way tap and pipes connecting the carburetter to the paraffin and petrol supplies, whereby the first few hundred yards may be covered on petrol and the paraffin then switched on, it is nevertheless most emphatically to be stated that the use of pure paraffin alone is highly unsatisfactory with all makes of machines. The economy effected is more than counterbalanced by the deterioration of the engine, the dirtiness of the machine after a few miles, and the discomfort of driving, and excepting when the normal fuel has inadvertently been allowed to become exhausted, and resource to paraffin obtained from a wayside cottage is the only course in default of pushing, the employment of this fuel should be rigorously eschewed, unless, of course, it be decided to employ a specially constructed carburetter, which procedure is assumed to be beyond the intentions of the rider.

It is, however, when paraffin is thinned down by the addition of petrol that possibilities of economy appear. Using all different proportions of paraffin to petrol in the mixed fuel, the writer has found that equal parts of the two liquids give the best results where comfort and economy are considered together. When much more than 50% of paraffin is employed the objections found to the use of pure paraffin appear, while less than 50% of paraffin leads to too small an economy on the year's running to make the trouble worth while.

### An Equal Paraffin-petrol Mixture.

Speaking from first hand experience with the Triumph carburetter (old type), the following particulars may be given. No adjustment of the carburetter float is needed, and an injection of the fuel as mixed will always result in a comparatively easy start. Knocking on hills, although slightly more noticeable at times, is not excessive, and can always be overcome by slight retardation of the spark; fuel consumption is slightly improved in average country, and in a hilly country is about the same as with petrol. The only apparent objections to the use of the mixed fuel are the two following: Firstly, a tendency on the part of the carburetter to accumulate dust in dry weather (this can be obviated by totally enclosing the carburetter in a loosely fitting linen bag), and, secondly, the trouble of mixing the fuel (this can be carried out with little trouble by using a quart mug, alternately filled with paraffin and then with petrol, and poured direct into the tank).

It may here be most strongly stated that no ultimate separation of the two liquids in the tank follows prolonged standing: paraffin and petrol are mutually soluble in each other to an infinite extent, and no amount of standing will ever result in the slightest increase in the proportion of the heavier fuel at the bottom of the tank. Increased wear in the bearings, owing to the paraffin oozing downwards past the piston rings and so diluting the lubricating oil in the crank case, has not been noticed, and, as a proof of this, it may be mentioned that the writer ran a 3½ h.p. three-speed Triumph with wicker sidecar and passenger for five thousand miles on half-and-half paraffin and petrol, and then for another five thousand miles with coach-built sidecar and passenger using petrol alone, before any rebushing was required. The bush wear during the first five thousand miles cannot, therefore, have been excessive. Excepting for a 3½ h.p. B.S.A. with B.S.A. carburetter that has been tried with one-third paraffin and two-thirds petrol with very similar results, no first-hand experience of the use of paraffin on other makes of motor cycles can be given, but the results should not be far different.

The economy effected by using the half-and-half mixture is not profound, but is noticeable with the usual 3½ h.p. Taking the price of paraffin as 10d. a gallon, and with petrol at 2s. 6d., a saving of about £5 15s. is obtained per annum if the distance covered in the year is ten thousand miles; with the lower yearly average of five thousand miles, the economy would be represented by half this sum. D. R. EDWARDES-KER.

## A Machine Gun Carriage.

Transporting the Gun Easily either by Hand or Attached to a Motor Cycle.

General design of the Rankin machine gun carrier.

**A**S everyone knows, machine gun sections are attached to all infantry regiments, and at present when the guns are transferred from one position to another they are carried by hand, which in many cases is a most fatiguing business. To overcome this, and also provide a means of rapid transport by attachment to a motor cycle, a special gun carriage has been designed and patented by two of our readers who are enthusiastic motor cyclists, viz., Messrs. W. Rankin and R. Player, of Messrs. Wrights Forge and Engineering Co., Ltd., Tipton, Staffs.

The carriage chassis is constructed of steel tube and is triangular in design. Two pneumatic-tyred wire wheels are fitted to an underslung axle, over which the machine gun is supported on a telescopic adjustable tripod by means of spring clips, which enable the gun to be quickly removed when required for use off the chassis.

### Attaches as a Sidecar.

In order that the carriage may be attached to a motor cycle for transport from place to place, one of the wheels is made quickly detachable, leaving a socket in the axle which provides the rear joint for attachment to the cycle. Two other adjustable connections are provided, which when not in use are

carried in a box situated under the axle. The wheel, when detached, is carried in any convenient position on the cycle. When attached to a motor cycle in this manner the outfit resembles the complete machines as at present used in the motor machine gun sections. The handle provided for drawing the carriage when detached from the cycle provides the support for the seat of the gun operator. A box designed to carry a large supply of ammunition is situated on the chassis in front of the gun. An experimental carriage has been built, and for testing purposes was fitted up with a dummy gun and loaded ammunition box, the total weight of which was the same as actual gun and ammunition. Test runs were carried out with the gun attached to a 6 h.p. Enfield, a passenger in the gunner's seat being carried throughout. The result, we are told, was quite satisfactory.

In reporting Italian trials and races we have referred to the desirability of British manufacturers cultivating the Italian market, especially as in the said competitions British machines have always done well. With export limitations on our trade owing to the war it is only natural that Americans should turn to Italy as elsewhere, and we now learn that an Italian dealer has taken over the four-cylinder Henderson agency.

The gun carrier patented by Mr. William Rankin and described on this page. The photographs show the experimental carriage, fitted to a 6 h.p. Enfield, with dummy gun and loaded ammunition box.

## Horizontally-opposed Twin Two-strokes.

### SOME EARLY EXAMPLES.

THE two-stroke horizontally-opposed twin-cylinder engine is by no means a new design. It was discussed in our "Correspondence" pages many years ago, some readers looking upon it as the ideal engine of the future. Many, however, had overlooked its outstanding defect in the matter of firing intervals; that is, when a two-throw crank is used and the pistons travel inwards and outwards together. This arrangement provides excellent mechanical balance, but the cylinders fire simultaneously, and are in this respect only the equal of a big single-cylinder. When a single crank is used and the cylinders are arranged to fire alternately, then the mechanical balance is upset, and one of the greatest attractions of the horizontal engine is negated.

#### A Fascinating Subject.

Whilst at Bristol recently we were discussing this subject with Mr. W. W. Douglas, and reminded him of a similar conversation we had two or three years ago at one of the Six Days Trials centres. During this first conversation, we were told that Messrs. Douglas Bros. had built a two-stroke horizontal engine on the lines of the present four-stroke Douglas and had found it wanting. In confirmation of this statement, Mr. Douglas promised to gather together the different parts of this engine—some of which had to be recovered from the scrap heap—and to rebuild the engine for us to see. We have since examined the engine and also the drawing from which it was made, the year it was constructed being given to us

When did the horizontal twin first two-stroke? A twin-cylinder two-stroke built by Douglas Bros. for experimental purposes in 1912. Two magnetos were geared together to obtain the simultaneous sparks.

A four-cylinder machine of 1907, and the first motor cycle to bear the name of Douglas. The cylinders are V-shape. Illustration from *The Motor Cycle* of Nov. 27th, 1907.

as 1912. So early was the engine that for the ignition two ordinary twin-cylinder Bosch magnetos had to be utilised. These were placed horizontally on the top of the crank case and were geared together. The engine itself was of the usual three-port type, crank case compression being utilised, and, in other respects, from the outside flywheel to the bore and stroke, viz., 60 x 60 mm., the engine was of standard type. The reason experiments were not continued, however, was on account of the fact that the firm came to the conclusion that a two-stroke engine having two separate cranks, i.e., cylinders firing together, was not so good in practice as it appeared on paper, and certainly was not equal to the performances of the 2¾ h.p. four-stroke Douglas.

As a matter of fact, Douglas history forms very interesting reading. Many of our older readers will recollect the Max motor bicycle being exhibited at the Stanley Show. It had tiny wheels and the rider stood on two footplates, no seat being provided. Mr. Douglas, even now, recalls with the greatest glee how he went buzzing along the tramlines of Kingswood on the first machine of this type which was produced, and how all the little boys ran after him yelling with delight—there was no difficulty in keeping up pace! The miniature Max had a single-cylinder engine made throughout in the Douglas works.

#### The Original Douglas a Four-cylinder.

The forerunner of the modern Douglas was the Fée horizontal twin, weighing about 70 lb., and a description of it appeared in *The Motor Cycle* of October 30th, 1905. Later it was transformed into the Fairy, on much more ambitious lines, until the Douglas, fitted with a magneto (which fitting practically rendered the machine a successful marketable proposition), made its *début*. The manner in which the Douglas came to the front by leaps and bounds by sheer merit is common knowledge. But it is not generally known that the first motor bicycle bearing the Douglas name had a four-cylinder "V" type air-cooled engine. Mr. Douglas, sen., reminded us of this fact in view of our recent article on the subject of four-cylinder motor cycles, and produced *The Motor Cycle* bound volume of 1907 in which an illustrated description appeared.

**Horizontally-opposed Twin Two-strokes.—**

Mr. W. W. Douglas went one further, and told us that this particular engine was for all the world like a modern Daimler aeroplane engine cut in half, and this fact had actually struck him a week or two ago when he enjoyed a flight on a Daimler-engined aeroplane.

**Other Early Models.**

To pursue further the origin of the horizontal twin-cylinder two-stroke, so far as *The Motor Cycle* is concerned, one of the first engines of this pattern to be made, illustrated, and described is one known as the M.I.P. This water-cooled engine was shown at the 1913 Olympia Show on the stand of the Cardan Cyclecar Co., and it was illustrated

in *The Motor Cycle* of November 27th, 1913. The engine was manufactured by G. Wailes and Co., and was intended for use on heavy sidecar outfits. The capacity was 496 c.c., and it had water-cooled cylinders. The pistons were of the trunk pattern, the bottom portion acting as the pumping piston, mixture being admitted to the cylinders *via* rotary valves.

Two other horizontal two-strokes, which were actually made and tested on the road about 1912 or 1913, were the production of a Mr. Murphy, of Birmingham, who recently showed us the two original experimental engines, both being of the pattern where even firing is obtained, but where the balance was imperfect. These engines are described and illustrated in another portion of this issue.

## A Good Soldering Outfit.

BY ROAD RIDER.

**A**NY tinsmith will tell you that amateur mechanics are seldom skilful with a soldering iron, and there is more than professional jealousy behind the assertion. A good deal of practice, coupled with some natural deftness, is essential to the production of good work with the ordinary iron, solder and flux. Clumsily soldered repairs disfigure a motor cycle. In these two facts must be sought the explanation of the fact that very few motor cyclists do their own soldering work. As garages are now suffering from a serious shortage of labour, I may do some readers a good turn by drawing their attention to the merits of the Tinol outfits, prefacing my remarks with the statement that a rider who has never attempted to solder in his life has just made a petrol pipe, complete with two coned unions, in my presence, and that the pipe would grace a Rolls-Royce. The Tinol outfits, which cost no more than a shilling or two, consist of a bijou petrol blow-lamp, telescopic soldering iron, and tin of paste; the paste contains both flux and solder, mixed together; the entire outfit can be carried in a jacket pocket. In operation it is simplicity itself, as may be gathered from a description of the two commonest soldering jobs which fall to the lot of motor cyclists; namely, re-fitting a petrol or oil pipe union and fitting a nipple to a Bowden wire.

**Fitting a Pipe Union.**

The end of the pipe is filed flat, so that it will butt squarely into the coned union, and the pipe is then burnished clean for an inch or so at the tip by holding it in a vice, and drawing a ribbon of emery paper to and fro around it. The coned union is then tested for fit on the pipe end; if it does not slide on easily there will be no room for a film of solder between the surfaces; if the pipe is on the large size for the union it can be thinned down by more sandpapering. Slip the nut down the pipe, making sure it is threaded on right way up. Anoint the pipe end all round with a thin layer of Tinol paste, applying it with a clean match or other improvised spreader. Slip the union into place. Direct the flame of the Tinol blow-lamp on to the coned union, and hold it there until a faint trickle of fused solder shows beneath the lower end of the coned union. Let the joint cool, and then

remove any trickles of surplus solder from the pipe by rubbing with the ribbon of sandpaper. For a smart effect re-burnish the entire pipe with sandpaper before remounting it on the machine. If the pipe needs bending to fit between tank and carburetter, it may usually be done cold, but, if at all hard, the pipe should be annealed by being heated to a red heat and then cooled by quenching in water; this will soften the metal.

**Attaching a Nipple to Bowden Wire.**

Bowden wire should always be soldered before it is cut to prevent unravelling, which weakens the wire, and renders threading awkward. Measure the length of wire required very carefully, and allow an extra quarter of an inch. Anoint this extra quarter of an inch with Tinol paste, and turn the blow-lamp on it till the paste fuses to the familiar silvery-white colour of running solder. Withdraw blow-lamp, let the soldered part cool, and cut the wire with the shears so as to leave, say, one-eighth of an inch of the soldered bit on the length intended for use. Take a nipple, and thread the wire through it, a task which the soldered tip will render easy. (If you had not soldered this tip, threading the wire through the nipple would have been much harder, and the wire would have been partly unravelled and weakened in the process.) Now cut the soldered bit  $\frac{1}{8}$  in. off with the shears—its work is done. Open out the strands of the new tip thus formed petal wise over the head of the nipple. Push the nipple down the wire, leaving the opened ends and the last half-inch of wire exposed. Anoint them with Tinol paste. Push the nipple back right up against the spread ends. Turn the blow-lamp on the nipple until you see the paste fuse with the ordinary appearance of running solder, then remove the blow-lamp and the joint will be perfectly made.

It is, in fact, an easy matter to effect any small repair by means of Tinol, in which it is possible to heat up the article itself by means of the blow-lamp, but if the flame is allowed to play on the solder itself it is likely to cause it to run into drops and fall off. In such a case it is better to use a soldering iron than a blow-lamp.

# MILITARY MOTOR CYCLING NOTES

## AMERICAN DESIGN FOR A MOTOR MACHINE GUN OUTFIT.

WE have already referred to the interest aroused in the United States in the part motor vehicles of all kinds are playing in the war, and it was only to be expected that sooner or later an American would turn his attention to a motor cycle machine gun outfit. As a matter of fact, sidecar outfits on somewhat similar lines to those of the British M.M.G.S. were

## COMPARISON BETWEEN RIDING IN FRANCE AND IN AN A.C.U. TRIAL.

WE have received a letter from E. M. Oliver, at one time secretary of the Purley and District M.C.C., and who represented that body on its A.C.U. committee, who is now a private in the M.T. section of the A.S.C. He writes: "Just recently I have had my photograph taken, and am sending you a copy to show you how I look after seventeen months of Army life, of which eleven

miles an hour, and out here one does not have to—in fact, were this the case, one could not get over the greasy *pavé*. The fact that there is no great hurry accounts for our seldom having dangerous falls, unless one is run over by a lorry before there is time to get up.

"Triumphs are doing good work out here. Douglasses abound, but a handle-bar clutch is really required to negotiate the greasy *pavé*. One day I am going to draw up a specification for a military machine; it will not have any levers; keeping one's fingers on the clutch and throttle levers creates the most fearful cramp."

G. T. Gray, the former Rudge competition rider, who holds a commission in the R.E. and is training despatch riders. He joined the army upon the outbreak of war, and has already seen service abroad as an infantryman and motor cyclist despatch rider.

## RESULT OF SHELL FIRE ON A MOTOR CYCLE.

A PHOTOGRAPH on this page shows a B.S.A. motor cycle after being hit by a shell. It belonged to a despatch rider who, luckily, happened at the time to be in a house some yards away. The tank has been blown inside out, and the machine riddled completely except the front part, which suffered considerably less. The front tyre is not even punctured.

It seems a tragic coincidence that the previous rider of this machine was killed some few months ago—the only casualty his section has suffered during eleven months' service in France.

A B.S.A. machine after being struck by a shell.

A design for a motor cycle machine gun outfit. An American is responsible, but if he were acquainted with the road conditions in France and Flanders he would eschew motor bicycles with trailers.

built in the U.S.A. and attached to Indian machines some twelve months ago.

The type now illustrated is altogether different. According to our contemporary, *Motor Cycle Illustrated*, the machine gun carrier can be attached to either side of the bicycle, or towed as illustrated, the former being the normal one for travel. As illustrated, we are told, a rearguard action can be fought. As a matter of fact, it is doubtful whether a trailer would be practical under any conditions of fighting. In France a heavy, unstable machine towing a heavy trailer would be impossible owing to grease.

Arthur Chapple, the designer, is "dickering" (whatever that means) with representatives of several European war departments with regard to the adoption of his outfit, but, however much "dickering" he does, we do not think the Clyno Co. need have any fears!

## THE MILITARY CROSS.

We heartily congratulate Temp.-Lt. Cyril Patteson, R.E., on his being awarded the Military Cross. Patteson will be best remembered to our readers as a competition rider of Moto-Rèves.

E. M. Oliver, formerly a prominent official of the Purley and District M.C.C., who has seen seventeen months' active service. (See previous page.)

#### DESPATCH RIDERS' DIFFICULTIES IN SOUTH AFRICA.

**A**LTHOUGH the fighting in what was German South-west Africa has been a thing of the past for some time, information concerning the work of motor cycle despatch riders in that campaign has been so scant that a letter we have received from a reader, in Johannesburg, who took part in the campaign referred to, is of great interest.

Upon the outbreak of war Mr. G. F. Huskinson (the correspondent in question) was working as a civil engineer on the veldt near Somerset East, Eastern Province. He had been using in his work a 1913 model Douglas for eighteen months previously, and it had done splendidly under most severe conditions. In November, 1914, Huskinson joined the motor cycle despatch riders for the rebellion and G.S.W. campaign, taking the veldt-stained Douglas with him; his experiences as a military rider are best told in his own words:

"For the two months of the rebellion I was riding in rain the whole time. On several occasions I had to ford drifts

with the water well over the engine, and the only trouble during the whole time was choked mudguards—the front and the side flaps of the back one. I might mention that my machine was not the only one to give trouble in that respect. For our country roads out here in wet weather good mudguard clearance is essential.

"I participated in that great trek up the Swakop river which ended in the capture of Karib and Windhoek. From a motor cyclist's point of view it would be impossible to picture anything worse. I think you will be able to appreciate it when I tell you that all the riders, irrespective of the power of their machines, had to jump off and run alongside for the major portion of the way up the river bed, as the sand was so thick it was impossible for the machines to pull the riders through. Out of about sixty riders who started from Swakopmund only about twenty-five arrived at Karib with the brigades, the rest having broken down *en route*, and of the twenty-five only four did the journey without outside assistance such as towing or being carried, machines and all, in waggons."

#### NOVEL USE FOR MOTOR CYCLE ENGINES.

**P**ETTY-OFFICER FRED WRAY, attached to an R.N.A.S. armoured car section with the Mediterranean Forces, has sent us some interesting news concerning motor cycles in his section.

In one of the R.N.A.S. repair shops a Scott motor cycle engine has been adapted to drive a dynamo, which it does most successfully. The engine runs beautifully on a Douglas-Amac carburetter, and after being set at a certain speed, according to the ammeter reading, in the morning, keeps going all day. It is started by a crank engaging on an extension of the magneto shaft. The magneto is on a platform across the crank case, driven from engine sprocket, the other sprocket being replaced by a pulley, which drives

the dynamo. As the starting handle only gives a half-throw, to prevent fouling the carburetter, it speaks well for the Scott that two or three pulls always suffice to start up. Another Scott is used for driving a lathe.

Mr. Wray goes on to relate how in one country where they were quartered a Douglas inhaled so much dust and sand that the deposit on the pistons consisted of an oil and sand sludge. In fact, the engine "seized" owing to this on one

Cpl. E. Daine Dawson, who before the war had a Government appointment in Gibraltar. He is now a despatch rider attached to a divisional headquarters in France.

occasion. Another rider fell in a sand-drift, the machine falling on its side. When an attempt was made to start the engine it would not run properly, and investigation showed the induction pipe to be full of sand. In both these instances there was no gauze over the air intakes.

#### A.B.C.'s FOR EGYPT.

**W**E illustrate a batch of  $3\frac{1}{2}$  h.p. horizontal twin A.B.C. machines that have recently been despatched to Egypt to the order of the Egyptian Government. These machines are fitted with the new A.B.C. clutch, the size of which has been considerably increased and is now hand or foot controlled; mechanical lubrication with auxiliary hand pump, four-speed gear box, a new enclosed kick starter, and, of course, the well-known A.B.C. system of leaf springing fore and aft. The transmission has been improved by the fitting of a double "cush" drive.

A BATCH OF  $3\frac{1}{2}$  h.p. A.B.C. MACHINES FOR EGYPTIAN SERVICE.

# A TWO STROKE WIZARD'S WORKSHOP

• A COLLECTION OF DESIGNS •

**A**LTHOUGH the origin of the two-stroke engine is so old, even more so than the four-stroke type, previous to 1908, when the Scott was first brought to the public notice, comparatively little was either thought of or known about the two-stroke. Since that time, however, makers and inventors have made a considerable study of this type, and during the last few years, especially the last two, great strides have been made in this direction. At different times practically every type of engine has been made on the two-stroke principle, including vertical twins, horizontal twins firing together or alternately, V twins with both even and uneven firing, engines with pumping cylinders, in addition to the well-known "baby" single-cylinder two-stroke.

When in Birmingham recently we were privileged to inspect a collection of different types of two-stroke engines which Mr. Murphy, of the Light Machine Co., the designer of the  $3\frac{1}{2}$  h.p. two-stroke Bullet engine, has been experimenting with for the past seven years, and all of which have run successfully on the road.

The present  $3\frac{1}{2}$  h.p. single, which has a bore and stroke of  $82 \times 89$  mm., has a number of points where it differs from the usual run of two-stroke engines, the chief being that it has inside flywheels instead of the usual outside one. The arrangement of the ports is somewhat novel, and tends to give a neat appearance, the carburettor being situated at the rear of the engine instead of at the side or front, as is usual. This is obtained by the inlet pipe passing through the transfer passage, which is, of course, situated at the rear of the cylinder, and is covered by a brass plate secured by four screws. Also the gas, when released from the top of the cylinder through the compression release valve, instead of

simply passing into the air, is conveyed down a small tube, through which it is impossible for flame to pass, to the transfer passage, whence it is again delivered to the cylinder. We are told that this results in a great saving of petrol where people drive on the

AN EARLY TWIN-CYLINDER HORIZONTAL TWO-STROKE ENGINE.

Parts of the first Bullet horizontal twin engine. This view shows the curious construction of crank and piston rods. The piston rod in the foreground is the earliest pattern where the piston was secured solid with the rod. The later pattern (above) has a gudgeon pin.

release valve, which is a very usual though undesirable practice on two-strokes. Roller bearings are fitted to the big end, the others being of phosphor bronze.

Mr. Murphy tells us that he usually runs his machine geared at  $3\frac{1}{2}$  to 1, a gear which the machine takes comfortably.

In addition to the  $3\frac{1}{2}$  h.p., which is itself a large engine for a two-stroke, a 6 h.p. single-cylinder two-stroke is also made. This engine has a bore and

$3\frac{1}{2}$  h.p. Bullet engine, showing novel release valve, which transfers the released unexploded gas back to the transfer port. By this means much gas is saved when the release valve is used frequently.

A later model horizontal twin two-stroke Bullet. In front will be seen the construction of the crankshaft and the method of connecting the halves by dogs.

**An Interesting Collection of Experimental Two-stroke Engines.**—stroke of  $90 \times 104$  mm., and we are told that it has proved most satisfactory on test runs. The cylinder cooling flanges are of a very extensive character, and the engine we saw, after considerable use, showed no indications of having been over hot at any time. This engine also has inside flywheels.

6 h.p. single-cylinder Bullet engine. The dimensions are  $90 \times 104$  mm. = 661 c.c.

Another type which Mr. Murphy has experimented with for a long time is the horizontally-opposed twin two-stroke, one model of which, he tells us, has proved most successful. The first of this type was made several years ago. In this engine the pistons were connected together by a solid rod, in the centre of which was a frame faced with hardened steel, which gave the necessary motion to the crankshaft. The pumping compression was obtained

between the bottom of each piston and glands situated in the ends of the crank case. Small inside flywheels were used on this model also. Alternate firing

was obtained, but the balance of the piston movement was by no means perfect, as both pistons travelled together. The engine, however, gave quite good results at speeds in excess of 25 m.p.h.

Just prior to the war Mr. Murphy was busy on another horizontal engine with cylinders of  $60 \times 60$  mm. In this model the crank case was divided into two separate compartments by a webbing, and the cylinders were somewhat staggered, so forming practically two separate engines. The crankshaft was decidedly novel, each half being made separate, and connected together when assembled in their respective crank cases by means of dogs. It was, therefore, possible to have any desired crank setting, and make the cylinders

$3\frac{1}{2}$  h.p. single-cylinder Bullet engine, with a bore and stroke of  $82$  mm.  $\times$   $89$  mm., showing the arrangement of transfer and inlet ports, both situated at rear of cylinder.

alternate firing, however, was adopted, and the engine covered many miles, giving most excellent results.

## Cattle on the Road after Dark.

**R**ECENTLY one of our contributors was returning from Leeds after nightfall on a Sunbeam sidecar outfit when, about two miles from that city, a large herd of cattle was encountered. Both drovers were at the rear of the herd, but fortunately the driver of the machine was able to pull up in time to avoid collision. The cattle, however, were attracted by the head lamp of the motor cycle, and though both driver and passenger shouted and waved, there was no turning the half-dazed creatures aside. Evidently they could see nothing beyond the lamp, for they crashed into the stationary machine, trampling over the sidecar and totally wrecking it.

By a miracle both passenger and rider escaped uninjured, and an hour or two later they reached home on the motor cycle, which was none the worse, leaving the much-battered sidecar near the scene of the accident.

Things might have been very much worse, however, and the fact that the cattle, dazed and attracted by the light, actually ran straight into the stationary machine should act as a warning to others that on these occasions it is not sufficient merely to

pull up and wait. The safest plan is to shield the lamp with one hand till danger is past, for the glare seems to have an almost hypnotic effect upon animals unaccustomed to traffic.

It is certainly time orders were enforced with regard to the drovers of sheep and cattle being equipped with lanterns, to be carried both in front of and behind the herd. The accident occurred in a district where there are no lighting restrictions, but where these prevail the danger is much greater. Sheep are particularly invisible: when meeting a

flock it is sometimes possible for the driver of a car or cycle to distinguish the shining of the animals' eyes in time to pull up, but when overtaking a flock the animals harmonise exactly with the roadway, and collision is almost inevitable.

Many serious accidents have recently occurred through the presence of livestock on the road after fall of darkness, and it is to be hoped steps will be taken to bring this matter into accordance with the present lighting regulations, for it is certainly time that this and similar anomalies were removed.

Mechanically-operated crank-case air release valve on the Harley-Davidson. The valve opens and shuts on the crank case compression and suction strokes respectively, and is driven from the engine mainshaft by gearing.

## A HOME-MADE RUNABOUT.

O. N. is the name of a home-made cycle car built by O. B. Newbould, Rawmarsh, Yorks. It is fitted with an 8 h.p. J.A.P. engine, B. and B. carburetter, belt drive, and variable gear. The petrol is carried in a tank above the engine, and the oil in a small tank on the footboard near the driver's right hand. The frame is

Belt-driven four-wheeler built by a Yorkshire reader and described in the accompanying letterpress.

constructed of hard wood, strengthened with steel flitches and angle plates. The body is grey, lined with black, and has a very sporting appearance. The principal dimensions are as follow: Track 3ft. 6in., wheelbase 7ft., ground clearance 6in., overall length 9ft. and width 4ft., tyres 650 x 65 mm. The illustration shows the machine in its early stages of construction.

## REMOVAL OF CYLINDERS.

OWING to the high ground clearance provided on American motor cycles, the cylinders come so near to the underside of the tank that it is difficult, if not impossible, to remove them without taking

Tank and tube detached and cylinder being removed. Note method of making joint.

the engine from the frame. To facilitate the removal of the cylinders, Mr. Frank A. Etwell, of Toronto, Ontario, has designed and patented a motor cycle frame. In this the lower horizontal tube, to which the tank is secured, is made detachable by the withdrawal of two bolts. The tank and tube are then lifted bodily out, leaving a clear space and giving easy access to the cylinders.

## PLUGS AND THEIR WEAKNESSES.

FREQUENTLY we receive for testing purposes sparking plugs of different manufacturers. We recently had three such plugs tested on the J.A.P. Works test bench. Two of these were expensive plugs of the single point variety, obtainable by the public at about 5s. each. One of them would not stand up under load, and the central electrode overheated and bent over, touching the side electrodes, in spite of being straightened twice. This was a plug which has only recently been placed on the market.

The other, the name of which we will not mention, but if we could do so it would be well known to our readers, stood up for two and a half minutes, after which the electrode bent over and the porcelain fractured.

The third plug, which, like the others, is of British manufacture, but is quite a cheap article, being sold at 1s. 3d., stood up very well under the brake test, but rather quickly oiled up, and shorting took place owing to there being not quite sufficient clearance between the porcelain and the body of the plug.

## SURRIDGE ACCESSORIES.

THE Surridge repair outfit is somewhat of a departure from the standard. With it is supplied a very neat little scratch brush for roughening the tube before applying the patch; a tube of solution, which carries the precious liquid quite safely and cannot be damaged; and also a brush for the application thereof. Numerous Holdtite patches are supplied, as well as a small box containing French chalk and valve tubes.

Our contributor "Road Rider" recently wrote an article on tyre repairs which led to a controversy about the most reliable methods of dealing with large gashes. Mr. R. Surridge, the patentee of the well-known Holdtite patches and solution, has sent us a sample repair of a huge longitudinal gash in an inner tube, and we are bound to say that all attempts to loosen the patch or extend the gash have failed, though both petrol and pliers have been employed in various attempts.

The most recent addition to the numerous Surridge rubber accessories is a

Surridge's latest repair outfit.

front glass dimmer, constructed of india-rubber, and intended to be placed over the glass in the manner shown in the accompanying illustration. It adequately

Surridge's rubber lamp dimmer.

dims the light, and also has the advantage of making the joint between the front and the lamp watertight and dustproof.

## THE LATEST LODGE PLUG.

## A Special Design for High-compression Engines.

IN addition to the special plug for two-strokes which we described in our issue of December 23rd, Messrs. the Lodge Sparking Plug Co. have now placed on the market yet another model somewhat on the same lines, but which is intended for use on racing or aero engines, or on machines where considerable heat and pressure exist.

The chief point about this plug is that it is designed specially so as to carry away the heat generated by this type of engine from the electrodes and insulator in as short a time as possible, and so reduce to a minimum any tendency to pre-ignite the charge or damage the insulation.

For this purpose it will be seen that the body is deeply corrugated in the form of radiating fins, while the brass terminal end of the central electrode is also grooved in order to expose a large surface to the air for cooling purposes.

The insulator is composed of mica prepared under a special process. The electrodes, which are made of nickel and form a single gap, are the same as those used in the special two-stroke model. The central one is simply a straight rod, while the other is in the form of a disc with a hole in the centre, a protuberance on this washer forming the second point.

The fact that these plugs have a high electrical capacity causes them to give a most effective spark.

The plug is finished in black, and sells at 7s. 6d.

The Lodge racing plug, which has radiating fins.

### TIME TO LIGHT LAMPS.

	GREENWICH TIME	
Feb. 17th	...	5.43 p.m.
" 19th	...	5.47 "
" 21st	...	5.51 "
" 23rd	...	5.55 "

### Motor Cycle Volunteers for Blackpool.

A motor cycle section is to be added to the Blackpool branch of the National Motor Volunteers.

### Motor Cycles in London.

During the quarter ending December 31st, 1915, the London County Council granted 11,705 driving licences and 998 motor cycles were registered.

### Lights on Sidecars.

The desirability of a general rule in the matter of lights on sidecars has often been urged in our columns. It has often seemed to us absurd that regulations of this kind should be left to local byelaws, and that what is necessary in one county may not be required in the next. Many motor cyclists put a light on the sidecar for their own convenience and safety, although it may not be a legal necessity in the district where they live, and we should advise all our readers to do so.

The following is a case in point. The driver of a sidecar outfit (4ft. 6in. wide) was proceeding along a narrow road (14ft. 9in.) on a dark and rainy night. There he met a traction engine (7ft. 10in. wide), which occupied the middle of the road and allowed only 3ft. 6in. for any traffic to pass. When the driver of the latter saw a light approaching, which he took to be that of a motor bicycle, he stopped his engine, but made no effort to draw to his proper side, nor did he attempt to give any warning. The traction engine lights consisted of two lamps 2ft. apart, hung from the axle, and it was not until the sidecar was within eight yards that its driver saw the nature of the obstruction. He then ran his sidecar wheel into the bank, and sustained some minor injuries. When he brought an action for damages at Hawick, the case was given against him, on the ground of contributory negligence, although it was found that the driver of the traction engine was in fault, this contributory negligence consisting of the fact that he had not a separate sidecar lamp, which would have indicated the width of his vehicle, in spite of such a lamp not being required by the byelaws of Selkirk, the county in which the accident took place.

### Flashlight Traps at Bromley.

Employing pocket flash lamps, police are said to be timing motorists up to 8 p.m. on the London Road entering Bromley. Several local motor cyclists and despatch riders have been stopped. As many pedestrians in darkened streets are using flash lamps, mistakes might easily happen.

### Police Activity in the Metropolitan Area.

Trapping is at present more prevalent in the extensive district known as the Metropolitan area than it ever has been. The police, we are informed, are instructed to work their controls at least two days a week, and motorists are more frequently than before prosecuted under Section I. (i.e. driving to the common danger). As much activity is shown in the parks as in the streets, and consequently the greatest caution should be displayed. The Metropolitan police area comprises much open country, and so it is advisable never to exceed the twenty miles per hour speed limit by more than a very narrow margin immediately outside town, and to adhere to it strictly in London itself.

### EX-TOURIST TROPHY RACERS.

G. Boyton, the Irish motor cyclist, now a lieutenant in the R.F.C. after many months' despatch riding, chatting with G. E. Stanley, the well-known record-holder on Singer and Triumph machines.

### SPECIAL FEATURES.

#### SOME NOVEL TWO-STROKE ENGINES

(Illustrated).

#### NEW DESIGNS.

### British Material in American Machines.

It is stated in America that the price of motor cycles there is likely to rise slightly owing to the fact that a great deal of the tubing comes from England, and now that so many of the factories are working entirely on munitions this is very difficult to procure.

### The A.C.U. Secretary.

Mr. T. W. Loughborough, secretary of the Auto Cycle Union, who was promoted to the rank of captain in the Queen's for services rendered during the South African war, is now second in command of the 2/1 (Croydon) Surrey V.T.C.

### Daylight at Last!

"I would very much rather see a man summoned for dangerous driving at five miles an hour across the entrance to some public building, such as a railway station," said Mr. Hopkins, the Bow Street magistrate, the other day, "than I would see police sent from Scotland Yard to set a trap in a place which they know will be quiet, and where motorists are likely to be going at a high speed." We commend Mr. Hopkins for this sensible and opportune expression of an opinion which *The Motor Cycle*, among others, has urged for years past.

### The M.C.C. Opening Run.

It has been definitely decided to hold an opening run of the Motor Cycling Club this year, and the date chosen is April 1st. Dinner will be served at the Old Ship Hotel, Brighton, at seven o'clock, and the president, Mr. Charles Jarrott, will occupy the chair. Mr. W. H. Wells, captain of the club, will be pleased to hear from all members who can attend, and will be grateful if they will write to him at 366, Euston Road, N.W., stating what accommodation they require for the night. Free garage accommodation will be provided for members of the club staying at the hotel or for dinner only, provided their names are handed in to the proprietors one day in advance. Mr. Wells hopes that all members of the club who can possibly attend this event will make an effort to do so. Friends of members, especially ladies, may be assured of a hearty welcome.

CLIMBING MAM TOR, NEAR CASTLETON, WITH FIVE PASSENGERS.

G. W. Wilkin driving a 2½ h.p. Levis lightweight sidecar outfit up this Derbyshire ascent last week end. It was one of the test hills in the A.C.U. One Day Spring Trial of 1914.

#### When Did the Horizontal Twin First Two-stroke?

Considerable interest has been aroused of late in the horizontal twin-cylinder two-stroke machine. Several manufacturers are now turning their attention to this type of engine, but as two articles in this issue show, examples were built for experimental purposes by one or two firms several years ago.

#### Expensive Ignorance of a Special Constable.

Percy Calderbank, an engineer and special constable of Wallingford, has been fined £10, or a month's imprisonment, at High Wycombe for having a movable lamp on a motor cycle. Defendant pleaded ignorance, but the Bench described it as amazing, and imposed the fine stated and ordered the lamp to be confiscated.

#### Further Hill-climbing in the Peak.

G. W. Wilkin, with a 2½ h.p. Levis and sidecar, gave another graphic hill-climbing performance at the week-end. In our last issue we chronicled his ascent of the Derbyshire hills Mam Tor and Sir William with three passengers. On Sunday he climbed the former with five passengers. A strong gale was blowing down the hill, but Wilkin managed to reach the top successfully with his big load. The Levis was geared 7 and 14 to 1. On some of the corners the wind was so strong that riders on high-powered machines were brought to a temporary standstill. There were approximately 200 to 250 motorists present to witness the climb. They had made the journey to Castleton on all kinds of motor vehicles.

#### The National War Funds.

At the week-end the principal war funds stood as follow:

The Prince of Wales's National Relief Fund (£2,978,000 distributed)	£5,747,218	0	0
Fund for the Sick and Wounded	3,324,534	0	0
Tobacco Fund	99,513	0	0
The Queen's Work for Women Fund	168,436	0	0
The Belgian Relief Fund	1,321,770	15	10

#### January Imports of Petrol.

Just at present the amount of petrol imported into this country is of more than usual interest. The following are the figures for January of this and the two preceding years:

Jan., 1916	6,985,276	galls.
" 1915	6,984,339	"
" 1914	9,487,091	"

According to the Board of Trade returns, duty has been paid on 9,175,909 gallons during the month ending January 31st last.

#### A Two-stroke Exponent.

Last week we had the pleasure of a visit from Mr. Frank Philipp, whose name is well known in connection with the Scott machine, by reason of his many exploits on that make. Mr. Philipp is not now engaged in the motor cycle industry, but at present holds an important position with Messrs. Thwaites Bros., general engineers, Bradford, whose speciality is cast steel road wheels for motor lorries. It is interesting to note that at least 75% of this trade was formerly in the hands of the Germans, and Messrs. Thwaites are reaping the benefit now that enemy supplies have been cut off. Our talk with Mr. Philipp naturally revived many pleasant memories

of competitions of the past. We competed in spirit in the T.T., imagined ourselves climbing Sutton Bank, and later dodging boulders up the different freak hills included in the various Six Days Trials. To keen motor cyclists it was like music in one's ears to talk of these happy competition days.

#### Ford Stories.

An intensely amusing series of Ford yarns will appear in our next issue, the result of a paragraph in these columns.

#### New Club Officials.

At a meeting of the Birmingham M.C.C. the following were elected as executive officers for 1916: Captain, R. W. Duke; vice-captains, T. Silver and S. Rodway; hon. trials secretaries, S. Rodway and W. H. Egginton; hon. secretaries, R. V. C. Brook and S. C. Perryman. As it is hoped to be able to revive the work of the club to some extent during 1916, it was unanimously decided not to reduce the present small annual subscriptions.

#### Patents in South Africa.

Mr. Benjamin T. King, A.I.M.E., informs us that a Bill dealing with patents in South Africa has been introduced in Parliament. Under this Act, which may be expected to come into force about the middle of this year, a patent will include the whole of the Union, viz., Cape Colony, Natal, Transvaal, and Orange Free State. This will mean a considerable saving in cost and simplification in procedure, and British patentees and manufacturers should take steps to avail themselves of the privileges thus afforded.

## The Starley Front Fork.

A Newly-designed Spring Fork in which Brazed Joints are Reduced to a Minimum.

**T**HE subject of spring forks is of more than usual interest just now. Reports reach us from time to time of failures to this vital part of some machines ridden by despatch riders in Flanders and elsewhere. Naturally, their machines are subjected to very much greater strains even than in a strenuous British trial.

Mr. W. Starley, who is known as a prolific inventor and patentee, showed us last week a new fork in which brazed joints are practically absent. The average front fork of the braced or reinforced type is built up of steel tubing and lugs. This entails sixteen brazings, each of which necessitates the tube being heated to a very high temperature to enable the brass solder to run and make a perfect joint. Each time the tube is heated in this way scale is thrown off both inside and outside, which destroys to some extent the strength of the metal, and in making forks and building frames of motor cycles a thicker gauge of tubing has to be used to allow for this. In the case of a front fork of the ordinary type, it has to be heated many times before it is finally finished and ready for filing up and polishing, and unless great skill is used in brazing, and also in the filing up, breakages may occur in the tubing at the points where the lugs terminate.

### The Method of Construction.

Mr. Starley has patented an original design of fork blade in which ordinary round or oval weldless steel tubing is eliminated. He first takes a flat sheet of steel, and by means of proper tools this is folded into shape, which in section is something like the letter "O" with a long tail. Reference to our illustration will show the shape of this section, which is very strong both laterally and longitudinally. If one were to take an ordinary flat piece of steel and fold it around a handle-bar in the form of a clip, and then electrically weld the two flat strips together at the top of the joint, one would have the section employed in the Starley fork. No reference has been made so far to any duplication of the blades, as we will call them, for the simple reason that the girder arrangement is dispensed with and the fork blade is single, yet it is quite as strong as, or stronger than, the double type. The fork ends are also made out of flat steel folded to shape and pierced and brazed to the blades. Brazing is eliminated at the bridge piece by bolting it to the flat section of the blade through which holes or slots can be made at any point desired for the attachment not only of the bridge, but also brake guides, spring holders, etc. The lugs at the top of the blades are also brazed in, and these four brazings are the only ones employed in the making up of the fork.

Our sketch depicts the fork with the flat section pointing in the direction in which the machine is travelling, but it can be just as easily turned round so that the circular part faces forward. We know that some riders are very much prejudiced against a fork where single

blades are employed; they regard the duplex type as being, if not unbreakable, at least so safe that in the event of a breakage to a blade the safety tube would hold up the machine long enough to enable a dismount before a collapse. Strictly speaking, it is somewhat of a fallacy, because if it becomes a question of depending on a single tube, the one which passes through the steering socket is single, although of tremendous strength. To our mind the Starley fork, made up in the special way described,

The new Starley front fork, in which brazing is practically eliminated. The right-hand sketch is a broadside view, showing that the circular portion may face forwards if desired.

is not only lighter, but, if anything, stronger than the double tubular brazed type; it should be cheaper to produce, and is certainly quite as elegant in appearance as any of the brazed type already employed.

It is the patentee's idea that any makers who take up his fork would use their own method of springing and lubrication of the shackle pins. A neat method of providing horizontal action for the fork is the subject of a separate patent.

### Another Useful Invention.

Incidentally, in connection with Mr. Starley's bent, which is inventing, it may be interesting to point out that he was the patentee in 1892 of the tubular tricycle axle, and the French rights were sold by him to M. Clement of Paris for use on motor cars. When describing this fork Mr. Starley mentioned that the idea of the tubular back axle came to him in the train between Milan and Turin. He had considerable difficulty at the time in producing tricycle back axles with four separate bearings under a

bridge, and eventually gave it up because it was practically impossible to keep the four bearings in line, and there was also considerable difficulty in keeping the grease from working out. Then it suddenly occurred to him, in the train, that the back axle could be made by joining two ordinary bicycle steering sockets together with ball bearings at each end, and the result was the tubular axle as we know it to-day on most cars, formerly made under royalty by many firms, but the patent rights have now expired.

### EXTENSION OF THE LIGHTING RESTRICTIONS.

**I**T was officially announced last week that, commencing to-day (February 16th), Part II. of the Lights (Vehicles) Order of December 15th last would be extended to the following districts:

Counties.	Areas.
BUCKINGHAM . .	Aylesbury (Urban District). Eton (Urban District).
CHESHIRE . . .	Chester (County Borough). Dukinfield (Borough). Hyde (Borough). Macclesfield (Borough). Stalybridge (Borough).
DERBY . . . .	Derby (County Borough).
GLOUCESTER . .	Bristol (County Borough). Cheltenham (Borough). Gloucester (County Borough).
LANCASHIRE . .	Accrington (Borough). Ashton-under-Lyne (Borough). Blackburn (County Borough). Bolton (County Borough). Burnley (County Borough). Bury (County Borough). Nelson (Borough). Preston (County Borough). Oldham (County Borough). Rochdale (County Borough). St. Helens (County Borough). Warrington (County Borough). Wigan (County Borough).
OXFORD . . . .	Oxford (County Borough).
SALOP . . . .	Shrewsbury (Borough).
STAFFORD . . .	Burton-on-Trent (County Borough). Lichfield (Borough). Stafford (Borough). Stoke-on-Trent (County Borough). Walsall (County Borough). Wednesbury (Borough). Wolverhampton (County Borough).
WORCESTER . .	Dudley (County Borough). Kidderminster (Borough). Worcester (County Borough).
YORKSHIRE . .	Barnsley (County Borough). (West Riding)

In districts covered by Part II. motor cyclists are allowed lamps up to 12 c.p., but with front glasses not exceeding 6in. in diameter and dimmed by at least one thickness of ordinary white tissue paper, paint, ground glass, or a disc of some other uncoloured material.

Half crank case and magneto platform casting of the Radco (see page 165).

## "THE MOTOR CYCLE" RECRUITING SECTION.

### RECRUITING FOR THE R.F.C.

WE are officially informed that sufficient motor cyclists have now been obtained for the Royal Flying Corps, but vacancies still exist for men with qualifications in the R.F.C. Trades. Vacancies which particularly interest our readers include motor transport drivers, motor cycle fitters, and engine fitters. The pay is 2s. per day in each case.

### THE MOTOR MACHINE GUN SERVICE.

IN response to enquiries, there are still no vacancies for despatch riders or motor cyclists in the Motor Machine Gun Service, but as regards the latter service there are batteries at present fully equipped at the training centre which will be proceeding overseas at a very early date, after which a certain number of experienced riders can be taken. A form of application may be included in our next issue.

### DESPATCH RIDERS AND THE GROUPS.

AS is well known, a great many motor cyclists have been drafted into the infantry after being called up under the Group System, on account of the fact that there have been practically no vacancies for motor cyclists. Mr. T. W. Loughborough, secretary of the D.R. Central Office, succeeded in getting exceptions to the rule that all men of Groups 2 to 9 were to be drafted to infantry units, to the extent of fifty motor cyclists from these groups. Naturally, the names of these fifty riders

were already on the waiting lists, the men having been examined and passed by the different inspecting officers.

### INSPECTING OFFICER FOR EAST ANGLIA.

ONE of the inspecting officers for despatch riders given on the War Office list for the East Anglian divisional area is Lt.-Col. Mowat, 74,

Broadway, Peterborough. A reader who called at this address advises us that he found Lt.-Col. Mowat had left Peterborough fourteen months ago, and his present whereabouts were not known locally. The lady who occupies the house now is constantly worried by motor cycle callers and letters from prospective recruits and also from the War Office reaching her daily. After this, motor cyclists may be saved fruitless calls.

A WELCOME RELIEF FROM THE TRENCHES!  
Two men of the Black Watch on leave enjoy a spin on a motor cycle.

## THE PRICE OF PETROL.

LAST week we hazarded the opinion that the price of Shell petrol would be raised to the same extent as Pratt's, viz., 2s. 6d. a gallon. We were wrong, though we hear from various quarters that Shell is very difficult to obtain. It is with much relief, therefore, we publish the following statement by the Asiatic Petroleum Co.:

"The situation in regard to supplies of motor spirit to this country, and the special responsibility which falls upon us as the owners of Shell motor spirit, has prompted us to address our clients direct, and explain to them the situation as it is to-day.

"Of the motor spirit requirements of H.M. Forces we are supplying five times as much as the whole of our competitors put together, but in spite of this great and constantly increasing strain upon our resources we have determined to maintain unchanged the price at which we have been supplying motor spirit to the public. Owing to the increasing requirements of the Forces we cannot maintain the supply of the same large quantities to the public as we have been able to deliver in peace time, and it is for this reason that we have asked our clients to limit their requirements to a minimum, and to use every possible economy in the quantities consumed.

"Our supplies of Shell motor spirit at present available to the public, after supplying the whole of the requirements of H.M. Forces, represent about one-third of the supplies in peace time, and we are of opinion that, having regard to the large number of motorists now withdrawn from this country, if our clients will exercise the utmost possible economy of consumption, we may still be able to satisfy at any rate the major portion of their requirements. We prefer to do this at the old price of 2s. 2d. per gallon rather than to take advantage of the national necessity for raising the price.

"We feel confident that, in continuing to reserve for H.M. Forces sufficient quantities to enable them to receive ample supplies of the finest spirit obtainable, we shall be acting in a manner which commends itself to the very great majority of our clients, and we confidently rely upon their being willing to co-operate with us by economising consumption, and thus limiting to the utmost possible extent imports, the increase of which, as is well known, is directly contrary to the national interests at present.

"It will be our constant endeavour to secure that garages shall receive at least one-third of the quantity of spirit which they have been accustomed to receive from us; and at the old price, which

enables them to sell to consumers at: Shell, 2s. 2d. per gallon; Shell II., 2s. 1d. per gallon; and Crown, 2s. per gallon."

A case was recently brought to our notice of a motorist who, being unable to get supplies of Shell from his agent, ordered Pratt's instead. Imagine his surprise when he was asked by Pratt's agent to give a guarantee that he would only buy this make of petrol, as otherwise the Anglo-American Oil Co. would not supply him. On being informed of the complaint an official of the Anglo-American Oil Co. said, "Our principal competitors have intimated their inability to supply the usual demands, owing, as they say, to their fulfilling Government requirements. Consequently we are called on to supply a great demand, and as facilities are not easy just now we must protect our own customers first. But our own people have no authority to make such pronouncements as that reported by your correspondent. I should say our local man was acting on his own account, and went farther than we would be prepared to support him."

From conversations we have had with officials of various leading petrol firms, we are under the impression that the position is likely to improve.

## An Ingenious Variable Gear.

Adaptable for Chain or Belt Transmission.

**Y**ET another variable gear, and one of extreme ingenuity, is the invention of Mr. Walter Parker, Little Horton Lane, Bradford. This device is distinct from most of its congeners in that it can be adapted for any kind of transmission, and permits an unlimited range of ratios between free engine and the solid top gear.

Fig. 1 is an end view of the device, showing its internal workings in section, while fig. 2 is clearly a longitudinal sectional view. The internal member A is keyed to the driving-shaft, and with it revolves the part C. On this internal portion is mounted the floating portion B, which carries the belt pulley or chain sprocket, as the case may be.

Between these two independent parts is the space D, and with the inner portion revolving and the outer portion stationary (free engine), the device might be likened to a rotary water pump, the member C representing one of the blades of the latter. The space D, however, contains several hundreds of  $\frac{1}{16}$  in. steel balls, which represent solid matter in as near a liquid form as possible, and shallow grooves are cut at the points *x*, into which these balls can sink. With the space D thus completely filled, the balls bind into a solid mass as it were, and compel the outer portion B to rotate

Fig. 1.

Fig. 2.

Showing details of the gear.

with the inner or driving portion. Thus a positive drive is obtained, and the range of speeds is accomplished as follows:

The blade C contains a valve, and when this valve is opened the balls are at liberty to pass straight through it in their natural line of travel, and the further the valve is opened the faster they can pass through. With the valve completely opened the blade C simply rotates through the balls instead of forcing them to rotate with it, and thus the inner and the outer portions can move independently.

The speed at which the driving portion A rotates the driven portion B, therefore, is governed entirely by the speed at which the balls are allowed to pass through the valve C, and thus the range of speed extends from solid drive to absolute free engine.

The device can be left to work automatically, the pressure of the balls forcing the valve open in propor-

A variable engine pulley gear. (Left) Parts of the dissected gear. (Right) Assembled gear and control mechanism.

tion with the load, or it can be notched in any position, the internal gear wheels shown governing the action of the valve only.

The invention is undergoing extensive road test at the hands of the Caledonia Engineering Co., Bradford, and has been adapted for direct belt drive as proving the most strenuous test for experimental purposes. We are informed that the results obtained are extremely satisfactory, and it is found that the balls are not perceptibly worn after some thousands of miles of running.

Mr. L. C. Desbuslais, of Amritsar, Northern India, and his twin-cylinder Hazlewood. The owner reports that his sidecar outfit has given very good service, and on occasions has been used for long runs with his wife and children as passengers.

## RADCO IMPROVEMENTS.

1916 Model fitted with an Extremely Neat and Efficient All-British Magneto.

Left to right: Near view of engine, showing gravity and suction drip feed lubrication to induction pipe. Spring fork, allowing for vertical and horizontal movement. Pulley side, showing the new Lion all-British magneto and the construction of contact breaker.

**L**IKE most motor cycle firms, the Radco Co., of Dartmouth Street, Birmingham, is so busy with munition work at the present time that much attention to motor cycle design is out of the question. However, a few slight alterations have taken place, the most important being the fitting of an extremely neat all-British magneto and a new oiling device.

The magneto is the production of the Britannic Electrical Co., Ltd., Birmingham, and is known as the Lion. The lightweight model, as fitted to the Radco, measures but 4 3/4 in. high by 4 in. overall width. All of the bodywork is made of die castings, which, in addition to its small size, combine to give an extremely neat appearance. The contact breaker differs from general practice, as, instead of having the usual bell crank and spring, these two parts have been incorporated in a Y-shaped spring, the contact points being situated at the single end of the Y, and they work in an in and out direction, so being unaffected by centrifugal force. We hope to be able to give a full description and illustrations of this interesting magneto at a later date.

Drilled connecting rod of the Radco engine.

The lubrication is now carried out by a combined gravity and suction sight feed drip, the oil being carried to the induction pipe, where it is broken up by the velocity of the gas, and conveyed in the form of oil vapour to the various

working parts. Mr. Radnall tells us he has found by extensive tests that this system is not only quite as efficient as the petroil system, but is so much more cleanly.

The mudguarding has also received attention, and is now most efficiently carried out. The rear guard, in addition to side valances, also has side extensions over the belt rim, the guard being connected by means of the rear number plate to the carrier, in addition to being supported by the stand, making a most rigid construction. Another minor engine alteration for this year is the design of the flywheel, which is now rounded in section instead of square, and rather heavier than before.

Well-known features of this handy and low-priced little machine are the

neat front forks, which give vertical as well as horizontal movement and the 24x2in. wheels, while on the two-speed model chain and belt drive is used *via* an Albion two-speed gear box. Aluminium footboards and most comfortably wide handle-bars are fitted. A most substantial stand and carrier are also supplied.

With regard to the engine, it is interesting to notice that, though the connecting rod is drilled, an undrilled piston is fitted. A solid crank is used, and the big end bearing is of the split variety, bolted together as in car practice. The magneto is carried at the back of the engine, mounted on a neat but substantial bracket cast in one with the crank case. It is driven by an enclosed chain.

Flywheel side of the 1916 model two-stroke Radco. Combined chain and belt transmission with a two-speed countershaft gear is fitted.

## “SPOTS.”

Yet Another Device for Economising Petrol for which High Claims are made.

“**S**POTS” is the name given to a recently introduced “dope” which, it is claimed, gives the motor cyclist more miles per gallon and more power than when using pure petrol. In America the word “dope” means a drug, and is used by motorists to denote a substance which is put into the petrol with a view to improving the running of an engine. The idea is, of course, not new in this country, and it is known that a small piece of camphor, or a naphthaline ball, such as is employed for keeping moths

from articles of clothing, improves the running of a motor cycle engine to a slight extent.

“Spots,” sold by the Coal By-Products Co., 112, High Holborn, W.C., closely resemble the latter in size, appearance, and smell, but, we are assured, contain no ether, alcohol, or acids, but special ingredients, which are a combination of highly concentrated volatile oils. One of the balls is placed in each two-gallon petrol can overnight, and in the morning the contents are poured into the tank. An increased mileage of at least 25% is

guaranteed, as well as more power. It is also claimed that at each explosion a film-like spray of oil is deposited inside the cylinder, and this prevents the formation of carbon deposit. It is further claimed that two balls in each case will remove the deposit from a badly carbonised engine. When “Spots” are used it is stated that more air may be given.

We are looking forward to a trial of the preparation in the near future, and if it does as well as the makers say, in view of the increased cost of fuel, its existence will be more than justified.

## The Carrying Capacity of Sidecars.

Sensible Location of Tool Lockers on a Montgomery Sidecar.

**T**HOSE riders who find the locker space provided on the average sidecar body insufficient will undoubtedly be interested in a special body produced by Messrs. W. Montgomery and Co., of Coventry, to the specification of a customer. This is of the coachbuilt variety, and is constructed of mahogany panels over an ash framework. The special feature is the manner in which every available space is utilised to provide extra accommodation for carrying any reasonably-sized articles or spares. The first space to be utilised is

that within the bulbous back, which hinges at a point about half-way down, so providing an extensive locker, and the fact that the whole back opens allows quite bulky packages to be stowed away. Below this locker is situated a tray which extends the whole length of the body, with a box attached at the rear end. This tray is 2ft. 10in. long, 16in. wide, and 3½in. deep, while the dimensions of the box are 14in. x 16in. x 8in. In addition to these two special lockers the usual ones under the seat cushion and in the nose of the body are still

retained, thus adding to its capacity. The body is, as is usual in all Montgomery models, excellently finished. The colour is black with gold lines, and has imitation cane panels, while the upholstery is in red pegamoid. When closed it would be almost impossible to notice that any special lockers are provided, and, as will be seen from the illustrations, the general appearance is in no way unsightly, while the extra carrying capacity will undoubtedly prove very useful, especially when on a long tour.

WEATHERPROOFNESS  
AND  
LUGGAGE-CARRYING  
CAPACITY COMBINED.

Montgomery sidecar with lockers, so arranged that in order to get at any tools or spares therein it is not necessary to disturb the passenger.

## Saturday's Wounded Soldiers' Outing.

**O**N Saturday next, at twelve noon, about forty Harley-Davidson sidecar outfits will start from St. Thomas's Hospital, Albert Embankment, S.E., the drivers thereof conveying a party of wounded soldiers to the Burford Bridge Hotel, where they will be entertained by the Harley-Davidson Motor Co., Ltd. After lunch there will be a first-class variety entertainment, at which the following artistes, among others, have promised to perform: Miss Irma Cuthbert (vocalist, London

Opera House), Messrs. Clifford Essex (banjoist), and A. C. Chapman (pianist). It is expected that Mr. A. Quintin Roberts, secretary of St. Thomas's Hospital, will accompany the party. It is largely to him that it has been made possible to organise the outing. As formerly, our own military authorities refused to realise that a sidecar was a suitable vehicle in which to take out a wounded soldier. Owing, however, to the fact that Mr. Roberts is the driver of a 3½ h.p. Blackburne and sidecar he

has had no difficulty in persuading the military commandant to acquiesce to the scheme. The company's managing director, Mr. Duncan Watson, and another director, Mr. Withers, will accompany the party. Each driver and passenger will be provided with a folder comprising a route card, programme, and menu. It has been suggested that each driver should take a spare waterproof for his passenger, as though it is hoped the weather will be fine it is best to be prepared.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

### Two and Four-stroke Lightweights.

Sir,—Referring to the last paragraph of your leading article in *The Motor Cycle* of February 10th, we do not know why you should make the statement:

"The fact of the Government being unfavourably disposed towards two-stroke engines provides a natural bar to the adoption of lightweight motor cycles."

Our opinion is that the four-stroke lightweight engine is far superior to any two-stroke. It requires far less attention, and is consequently less trouble to run. The valves need not be looked at for many thousands of miles, nor will there be any carbon to worry about, say, in 4,000 to 5,000 miles. Of course, there are four-stroke engines that give trouble, but all must not be placed in the same category.

THE M.A.G. ENGINE CO., LTD.

OSBORNE DE LISSA, Director.

[Regarding Mr. de Lissa's comments, surely he must know that there are lightweights and lightweights! We would remind him that machines of the four-stroke type, scaling as much as 180 lb., are constantly referred to under the elastic term "lightweight." In writing our article we had in mind the genuine lightweight two-stroke of about 220 c.c. As to our opinion of the respective merits of two and four-stroke engines, the observant reader will have had plenty of opportunity of judging from articles in this journal during the past few months.—ED.]

### Two-stroke Design.

Sir,—We do not wish to enter into a newspaper controversy with either Mr. Martin or Messrs. Butterfield, Ltd., in regard to their remarks in your issue of the 10th inst., but we would claim your courtesy for a brief reply to each.

Mr. Martin presumes we wish to "slate" his design. How he can construe our letter to convey any such meaning is beyond us. We used the term "mixed feelings" to imply surprise and satisfaction that the design we had in hand was considered by him such a step in advancing the two-stroke principle. We may say that our design goes much farther than Mr. Martin's, as will be seen in due time. We, in common with other manufacturers, recognise that the present type of engine has shortcomings, but we maintained that its simplicity and efficiency far outweigh the few disadvantages there may be.

With regard to Messrs. Butterfield's letter, we may say that we were experimenting with our horizontal twin for quite twelve months before any notice of it appeared in the press, and we did not simply put an ordinary cylinder at each side of an ordinary crank case, but worked on original lines.

We forgive the veiled sarcasm *re* our twin being "premature," as we know the Connaught was a bitter pill for them to swallow, but we may say that the only reason for this model not being sold has been our inability to obtain crankshaft forgings and labour, our machines being almost fully occupied by war work, and the few available machines not so occupied were full up with work for standard models on order.

Our twin is a proved success, and, as a matter of fact, we are now busy on large quantities of parts for this engine, which will be offered for sale as soon as possible.

THE BORDESLEY ENGINEERING CO., LTD.

JOHN D. ROWLAND.

Sir,—Mr. J. Martin, in his reply on page 137 of your last issue to criticisms of his original article, accepts our conclusion that a reasonable amount of exhaust gas does no harm, and then qualifies it by contrasting two sets of entirely supposititious figures. So much for the disease which is mythical.

Now for the proposed cure. If an engine be controlled entirely by the release valve, then the throttle must be fully open all the time. The pressure in the crank case, and therefore the negative pressure on the piston, would always be a maximum; the increased amount of petrol in the crank case means all the more to separate out and mix with the oil or go stale. The result of lowered compression in the cylinder is to lower the peak of the pressure volume diagram, and reduce the effective mean pressure on the piston. All this, together with the loss by gas friction in the release valve passage, would combine to give the most wasteful engine imaginable.

The release valve is useful for sudden stops or momentary checks for which it is not worth while altering the throttle position. That is the limit, with mechanism or without.

The above is a justification of the general trend of two-stroke design for engines both small and large. For the rest, we would assure Mr. Martin that at least one  $3\frac{1}{2}$  h.p. air-cooled single does exist, for we make it ourselves, and call it the Bullet; moreover, we believe that an American firm makes a 6 h.p. As for patents, ours cover an ordinary release valve communicating with the transfer passage, but do not, of course, stand in the way of the variable compression idea.

BIRMINGHAM LIGHT MACHINE CO.

H. R. HUGHES.

Sir,—"Rolyat," in your issue of January 27th, denies that the two-stroke is a coarsely running engine, as he finds his so flexible. He then admits that his flexibility is only 20 m.p.h., as his machine will only two-stroke at speeds from 6-26 m.p.h. Most four-strokes of similar power have a flexibility of over 30 m.p.h.

The simple system of ports on the two-stroke is not a good mechanical proposition for several reasons: (1) The timing is very different from that which one would adopt if all the valves were cam-operated; (2) the eddying exhaust gums up the rings while the port is opening; (3) the passage of the piston rings past the ports is bad for the rings and the ports.

I think that in many cases engine rattle is directly attributable to the passage of the rings past the ports, although I believe that engine rattle is more often caused by the piston striking on a carbon ring in the cylinder. Recently I came across an old four-stroke which konked on advancing the spark too far, but emitted a noise exactly similar to engine rattle in two-strokes at all speeds. Inspection showed that wear had produced a ring at the top of the stroke in the cylinder. Filing the edge of the piston so that it did not hit the ring cured the trouble at once.

Mr. Martin's variable compression device for two-strokes is a great step towards raising the thermal efficiency at low speeds. I think that its use will make single-cylinders of  $3\frac{1}{2}$  h.p. and over a great success. Mr. Martin did not mention that the gas is warmed by its cycle from the crank case to the cylinder and back. This should make the machine more economical.

A. B. K. WATKINS.

### A Plea for Spring Frames.

Sir,—I should be most grateful if you will allow me the opportunity, through the medium of your paper, of asking your readers if they can suggest any fitment which will eliminate or, at any rate, lessen to a great extent the shocks due to the present appalling conditions of the road surfaces. My machine is a 1916 model with an ordinary unsprung frame. I have been recently invalidated out of the Service, and unless some means are forthcoming whereby the present terrible jolting is, in a great measure, mitigated, I am afraid my motor cycling days will come to an untimely end, which is the last thing in the world I wish to happen. May I add a word of tribute to your excellent journal, which I have taken in for a number of years, and which now, like a motor cycle, I could not do without? EX-L-CPL.

### Sparking Plug Design.

Sir,—May we comment upon the Forward Motor Co.'s letter appearing in your issue of the 3rd inst.? The coincidence of similarity of design may be extended even further than they point out. In the year 1908 Dr. A. M. Low patented a plug (No. 8,628), known as the Cup detonating plug, the firing points of which were shaped according to sketch A. The design of the firing points of the Forward Co.'s patent of 1911 (three years later) is shown

as sketch B. Is there not a "curious similarity" here also? We really fail to see how, in regard to the above, the stigma of "copyist" can be applied to Lt. Burton's idea (sketch C).

We take it that Lt. Burton's idea is that the gas imprisoned around the insulator and within the cavity (C1) formed behind the inverted cone may, in its escape during the inlet stroke of the piston, exercise a cleansing and cooling effect. The essence of the design and the so-called venturi action would appear to lie in the slot perforations arranged around the base of the inverted cone. Where is the prototype of these in the Forward Co.'s patent (sketch B)? Admitted that both types fire from a central electrode to a surrounding ring—so do scores of other makes of plugs, dating back many a year.

We have until now held the view that the function of a plug was to place the spark with regularity and accuracy, and we were unaware that it was possible to obtain a venturi action through a needle eye or a "conical form of cup" (sic) suspended within the cylinder, or even to thread the exploding gas through the same in a given direction for the purpose of any action whatever, venturi or otherwise.

THE SPHINX MANUFACTURING CO.

### Four-cylinder Motor Cycles.

Sir,—In view of the prejudice there is against four-cylinder cycles, may I heartily endorse the letter under the above heading by Wm. O. Harvie in your issue of February 3rd?

I have a 1914 four-cylinder 5 h.p. F.N., and I have not had even your correspondent's trouble with new inlet valve springs. I change the inlet valve springs about every 1,000 miles, and can always run at about six miles per hour on top gear with the engine ticking over.

I am glad to see that "Ixon" is now beginning to admit that four-cylinder cycles may have some good points. I think the F.N. and the Henderson are the only motor cycles worth mentioning or riding, but I like the shaft drive because it is weatherproof. I ride solo, and would ride a 7 h.p. F.N. or a 10 h.p. Henderson solo if it were not for the present hard times. Besides the engine there are many points where the foreign machine beats the conservative English motor cycle; for instance, all the English machines have the front forks bristling with coil springs waiting to be cleaned. Why cannot these springs be put in grease-packed cylinders, as on the F.N. and American machines?

I may say I have no connection with the F.N. Co. or the Henderson.

J. ALGERNON HALLAM.

### Lightweight Sidecar Outfits.

Sir,—Having seen "Two-stroke's" enquiry for information respecting the performance of two-stroke sidecar outfits of 350 c.c., I have pleasure in giving my experience of an outfit of this class.

My machine has an engine of 336 c.c., fitted with a two-speed countershaft gear, no clutch,  $\frac{3}{4}$  in. driving belt, and  $\frac{3}{8}$  in.  $\times$   $\frac{1}{2}$  in. chain. This machine was delivered to me in July last. I fitted a Watsonian featherweight sidecar to make up the combination. The gears fitted were 5 to 1 and  $9\frac{1}{2}$  to 1. This outfit ran satisfactorily with a load of 20 stone for about 1,000 miles, climbing all main road hills encountered. Petrol consumption varied between 70 and 80 m.p.g. The average speed worked out at about 15 m.p.h.; speed bursts on the level, 25 m.p.h.; but I found that it took too much out of the engine to indulge in this speed for long. I find that from 18 to 20 m.p.h. suits the engine best. At the end of 1,000 miles I found what I thought excessive wear on the flywheel bearing. Upon taking the engine down I discovered the crank pin had come loose in the web. I communicated with the makers, and they attributed this mishap to the harsh gear change. However, they treated me very nicely, forwarding me on a new shaft free of cost. I also took the opportunity when I had the engine down of lowering the gears to  $5\frac{1}{2}$  and  $9\frac{3}{4}$  to 1, and up to the time of writing have done 500 miles. The lowering of the gear has made things easier for the engine.

I must not forget, by the way, to mention the Harcourt radiators, which I added when making the overhaul. They are everything the makers claim for them. I also found that my silencer was creating back pressure, the silencer being a plain aluminium drum. To relieve the back pressure I fitted a  $\frac{3}{4}$  in. extension pipe parallel with the existing one. This removed the back pressure, also it has eliminated a good deal of blow-back from which I used to suffer. The only blow-back I get now is from careless manipulation of the air lever. The engine, of course, is a little noisier.

During the 1,500 miles of running my belt has pulled out six times, and the chain has broken once. Threequarter inch belting is too small for the double load; the same remark applies to the chain. My impression of these lightweight outfits is that better value could be obtained in investing the £50 in a second-hand  $3\frac{1}{2}$  h.p. combination. As regards lubrication, my machine was fitted with a drip feed into the induction pipe, which I have discarded in favour of petrol. This system is more economical in oil, but rather messy.

Since using petrol on a 16 to 1 ratio I have never had an oiled-up plug, which I was constantly getting with the drip feed. My drip feed is a very crude arrangement, the oil being fed by gravity. It used to waste more oil than it used.

TWO-STROKE COMBINATION.

### A Simple Single-seater.

Sir,—I am enclosing a sketch of a cycle car which I have designed on simple scale. The wheelbase is 6ft., or the same as the Morgan. The engine is intended to be an 85 $\times$ 88 mm., but I cannot decide on the gear, whether it shall be a hub or a countershaft three-speed. In any case the drive will be from the engine to a countershaft in front by chain, and from the countershaft to the back wheel by belt. The starting handle will be on the countershaft, and the petrol tank attached to the back of the seat (A.C. style), the oil tank being under the dash. The rear mudguard will be pivoted at the front, and will consequently move with the fork and allow of the wheel being taken out.

H.G.

Diagrammatical illustration of three-wheeled monocycle referred to in accompanying letter from H.G.

### Commonsense about the Motor.

Sir,—I was very pleased and honoured to read in Mr. Worsdale's article, "Commonsense about the Motor," that he includes my valve system in the specification of an ideal machine.

I wish respectfully to point out, however, that what he terms a modification of my type is embodied in my patent, viz., the double exhaust port. If he tries it he will find it is all right for racing, but the other type is much better for touring or commercial engines. There are two good reasons why this is so. In the first place, allowing the valve to exhaust out of the top of the cylinder does not keep it so cool, and the absence of the vertical walls takes away the excellent guide. The guide which Mr. Worsdale suggests, he will find, does not operate too well owing to difficulty in lubrication, dust, etc.

Another important point is that the vertical walls allow the exhaust a cleaner exit, i.e., the valve does not cause any baffling as it is pushed up against the pressure in the cylinder. It will be found that the exhaust is not so noisy with this type of valve as it is with the ordinary poppet valve, which, I think, is on account of the vertical walls allowing the gases to slide out, as it were.

MOTOSACOCHE, LTD.,

OSBORNE, DE LISSA, Managing Director.

### Varying the Power of Electric Lights.

Sir,—In reply to a letter from Mr. G. E. Mortley, which appeared in *The Motor Cycle* dated January 20th, in which he criticises my suggestions for the variation of electric lights on motor vehicles, etc. He says there that a six volt dynamo will give a voltage of fifteen to twenty if the main connection is severed. I quite agree with him, for the simple reason that there is no "load" on the dynamo. As a voltmeter takes very little current to work it, what else can be expected with nothing but the meter to consume it? Take a rubber gas-bag, as used with acetylene lamps, for instance. Supposing the tube gets squeezed after it leaves the bag, thus blocking the outlet, does "G.E.M." think the bag would retain its normal size? I do not. He then compares a break in the circuit with a resistance. I fail to see where the resemblance comes in. A resistance consumes current. If not, why is it connected with electric motors for starting purposes? If an electric motor (pulling a load) is started with a simple "knife" switch and no resistance in circuit the current will short through the armature and blow the fuse. If a resistance is used the motor does not get the full current until the resistance is entirely cut out. Therefore, if a resistance does not consume current, where does it go? To sum up, with a resistance in circuit there is a load on the dynamo; with a break in the circuit there is none, so how can Mr. Mortley compare these with each other? To prove what I say is correct, I personally work a P.D.M. testing set for testing horse-power. This comprises in brief a dynamo and a huge wire resistance to consume the current when generated. As more wire is brought into circuit (without altering engine speed) so the voltage will drop, and as it is gradually cut out so will the voltage rise. He then advises connecting two parts of an accumulator in parallel, a practice which is generally disapproved of in electrical "circles," as one will charge into the other.

X.Y.Z.

### Despatch Riders and the Groups.

Sir,—I have just been reading a letter from C. Larwood, who says he is wondering "what consideration I and many other motor cyclists will receive when called up to report with the groups."

I do not know what consideration he will receive, but I jolly well hope he will not receive any, but be shot straight into one of the mud-slugging infantry regiments.

I would like to know what consideration he has given to the motor cyclists who enlisted way back in August and September, 1914, and chanced getting into M.C. units. In my humble opinion, it is a piece of absolute cheek for him to complain at all.

Almost every week there has been a letter from one of these people who have hung back until the last minute, but we never hear about the people who did not stop to argue the point, but went straight ahead and joined up at the commencement of the war. There are hundreds of these in the Army to-day, and when we read about people

like C. Larwood we feel pretty well fed up. I have talked to lots of other motor cyclists in infantry regiments, and they are all of the same opinion as myself.

I should just like to say that the one bright spot in the week from a motor cyclist's point of view is the Friday morning when *The Motor Cycle* appears. I got mine by the morning post, and while I have been writing this four people have asked for it.

I must apologise for taking up so much of your valuable time, but I feel pretty strongly on this point.

R. D. LINFORD (Sgt.).

### Improving Mudguards.

Sir,—A large number of your readers as well as your contributors have given much time and thought to the question of efficiently mudguarding the modern motor cycle. As I use my machine for travelling to and from business almost daily I have also decided that very great alteration needs to be made to a machine as delivered by the makers before one can consider it and the rider efficiently protected.

I have been experimenting with my 6 h.p. water-cooled Humber, and I now claim to have efficiently protected myself in the following manner:

I firstly removed the standard mudguard with its absurd side flaps, holding the mud in, and substituted a plain, slightly curved mudguard 8in. wide, which, I find, entirely prevents the mud flying back when travelling, although, I think, on a very wet day a slight turn back inwards at the inner edge might be an advantage.

Next, I had to protect the machine from road splashing from the front wheel. I have been able to do this very efficiently, because of the water cooling, as there is no need to cut holes in the shield to allow for the cooling of the cylinders. I have had the shield carried from immediately below the radiator, from which point it gradually widened until it was the full width of the footboards at the front right to the back of the engine so that everything is now well protected. It was a certain amount of trouble to fit the front guards because of the clearance required for the front fork springs, but Mr. Victor Horsman (who is well-known at Brooklands track) personally superintended the job for me at his repair depot, Hart Street, Liverpool, and has made a first-class job of it.

S. W. PHILLPOTT.

E. G. Mauer, until recently vice-president of the Moscow Motor Cyclists' Society, and now rider of an Indian in the motor cycle section of the Russian Army. Mr. Mauer is a keen rider, well-known in Moscow motor cycling circles, and much of the success of the society is due to his efforts.

# QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

## Licence for Tricar.

? What is the motor tax on motor vehicles of the Morgan, A.C. Sociable, and the Williamson Cycla type?—W.G.N.

The local taxation licence for any three-wheeled vehicle is £1. If, however, the weight exceeds 3 cwt., it will have to be registered as a car, and car numbers obtained, the fee for which is £1 ls., as against only 5s. if the car is less than 3 cwt.

## Timing a Four-cylinder.

? Please tell me the best way to time my four-cylinder F.N. motor cycle as regards the firing and exhaust valves. The engine is the old type with automatic inlet valves, and fitted with a B. and B. single-jet carburetter. The machine is fitted with a two-speed gear and coachbuilt sidecar. I have overhauled the engine, reground the cylinders, fitted new pistons and rings, and had engine running with 5 mm. advance. I can do thirty miles per hour with an empty sidecar, but it dies out on a long hill. Can you tell me the cause of this?—J.A.

The engine should be timed in the following manner: Turn the crankshaft until the piston of the back cylinder is five to six millimetres from the top of the compression stroke. Unless the slide holder on the crankshaft has been altered, the carbon brush of this will point to the position of the bottom right-hand terminal of distributor, assuming the latter is in position. Now grasp the contact breaker of the magneto, and turn it until the maximum resistance is felt, and slide the magneto gear wheel into engagement with the corresponding wheel on the crankshaft of the engine. Having bolted up the magneto and fitted on the distributor, verify the timing. The points of the contact breaker should commence to separate when the back cylinder piston is in the aforementioned position. The wiring of the distributor in relation to the respective cylinders is: bottom right wire to back cylinder; top right wire to third cylinder from back (or second from front); bottom left wire to second cylinder from back; top left wire to front cylinder. The lengths of the wires will, in themselves, show to which cylinders they go. The exhaust valve should be set to close just after the piston has reached the top

of the stroke. It is hard to say why the engine dies away on a hill. Possibly this is through overheating. However, after the cylinders have been reground, and new piston and rings fitted, the engine will have to run for a short time before it will develop its full output.

## Position of Rear Lamp.

? In the new rear light Act is it a fact that the red light has to be fixed to the extreme right side of the motor cycle? I have lately fitted several electric rear lights, and have fixed them on the sidecar.—H.B.

Although it is not exactly illegal to place the rear light in the centre of the machines, it is always advisable to carry it on the extreme off side when possible, especially now that head lights are practically prohibited and side lights so reduced.

## Removing a Cylinder.

? My machine is a 2½ h.p. two-stroke, which I have used for going backwards and forwards to work, a distance of twenty-five miles each day. I have not used it of late owing to the bad weather. As I was contemplating using it again soon, I thought I would take the engine down and remove the carbon deposit. After removing the four holding-down nuts and other connections, I attempted to lift the cylinder off, but it would only lift about 1½ in., and after much pulling and straining it became so fast that it would not move in either direction. I have tried pouring paraffin into cylinder and leaving it to soak, and several other methods, but without success. I should be obliged if you could suggest what is likely to be the cause of the trouble.—N.R.

It is probable that your trouble is due to a broken piston ring, which on passing one of the ports has sprung out slightly sideways into the port, so preventing the cylinder from sliding off further. You should remove all connections from the ports, and ascertain if this is so or not. The only other way seems to be to remove the valve fitting at top of cylinder, and while attempting to lift the cylinder at the same time gently tap the top of the piston with a piece of wood inserted through the release valve orifice.

## Too Noisy a Machine.

? I have recently purchased a 1912 4 h.p. motor bicycle with sidecar. The other day I was stopped by a police inspector and constable, as they said my engine was making too much noise. They anticipated finding a cut-out which I have not got, and said the silencer had no business to have holes in such as it had. There were four on one side and ten on the other, not nearly as large as a threepenny bit. These, they said, must be stopped up. The garage proprietor from whom I bought the machine stopped them up for me, but, of course, the engine got abnormally hot with very little work. I have opened five of the holes, three on one side and two on the other, but the constable who stopped me recently saw me again, and said there was too much noise still. I am at a complete loss to understand how it can be so. The silencer is all right and is the ordinary type of thing, but has no baffle plates. The police, however, were unable to put their hand upon the regulations when I called at the police station a few days later, and I should be glad if you could tell me what these are.—J.F.H.

Unfortunately you are absolutely in the hands of the constable, who has really treated you quite well, as he could have summoned you on the spot if the machine, in his opinion, were too noisy. The difficulty could be overcome by stopping up all the holes, if the silencer is of the design we think it is; namely, merely an expansion chamber with a fairly long exit pipe. This should give a sufficiently free exit for the exhaust without causing overheating or loss of power. If, however, the silencer is not designed in this manner you could have a new one made as suggested, or could purchase one of the many silencers sold for attaching to most standard motor cycles. The silencer regulation reads as follows: "He shall not use any cut-out fitting or other apparatus or device which will allow the exhaust gases from the engine . . . to go straight into the atmosphere without first passing through a silencer, expansion chamber, or other contrivance, suitable for reducing, as far as may reasonably be practicable, the noise which would otherwise be caused by the escape of the gases."

**SPECIAL NOTICE.**—Copies of "The Motor Cycle" may only be sent to neutral European countries if posted direct from the offices of the publishers, or by newagents who have obtained permission from the War Office for this purpose. The publishers of "The Motor Cycle" have obtained the necessary permission, and, consequently, can send subscribers' copies as usual. Before sending through newagents it is important to enquire if permission has been obtained, as otherwise copies intended for neutral European countries will not be forwarded by the Post Office.

**Lubricating a Two-stroke.**

**Q.** (1.) I own a 2½-2¾ h.p. two-stroke. Could I fit a lightweight sidecar and carry a passenger weighing 9 stone without doing any very great harm to the machine? (2.) I give my machine one pumpful of oil every three miles. Is this the correct quantity? (3.) Does the magneto which is fitted require any lubrication? There are no holes in which to lubricate. Has it fibre or wood bearings? (4.) I have run it about 2,000 miles, and have always been able to give full air at any speed. Lately, however, I have not been able to give full air except at a speed of about 20 m.p.h. without backfiring. I have cleaned the engine of carbon deposit, plug, exhaust box, and also the carburetter, and have made quite sure there is no air leak anywhere; also the timing is, I believe, quite correct, viz., contact points just breaking with piston on top centre (spark fully retarded). Can I remedy this, or does it not make any difference to the engine? I notice it gets rather hotter than it used to do.—W.R.C.

1.) Light sidecars are very frequently used with these little machines, and, if carefully driven, there is no reason why damage should result. (2.) One pumpful of oil every three miles sounds rather too much, but it depends largely on the size of the pump. With a two-stroke it is really better to have a drip feed of some kind, so that the engine obtains an even quantity of oil the whole time. So long as the engine does not emit blue smoke all the while it is not being over-lubricated. If it is obtaining about the correct amount of oil there should be signs of blue smoke from the exhaust when opening out after running slowly for a short time. (3.) If no provision is made for lubrication the magneto is evidently lubricated by means of grease packed into the bearings, and should last

for a very considerable number of miles, probably 5,000, after which distance the machine should be taken apart and fresh grease inserted. The bearings are probably of the ball variety. (4.) The reason that you are unable to give as much air as previously may be due to any of the following reasons: (a.) The atmosphere being colder. (b.) Partial stoppage of one of the petrol passages or jet in the carburetter. (c.) Slight air leak either between the carburetter and engine or somewhere in the crank chamber. If the machine will take full air at speeds above 20 m.p.h. and will take a certain proportion when running at slower speeds it would seem as though the carburetter were adjusted about right.

**Lighting from Magneto.**

**Q.** If the low-tension current of a motor cycle magneto (single-cylinder) is used for lighting:

(1.) Is the light constant or intermittent? (2.) Is the magneto damaged in any way? (3.) Is the intensity of the spark at the plug appreciably affected especially at slow speeds? (4.) Does the voltage vary much in relation to speed of engine? (5.) What is the lowest volt lamp that can safely be used? I have tried the ordinary flash lamp bulb (about four volt, I believe), which burnt out in a few seconds at a fairly slow armature speed. I propose to adopt this method for a sidecar light if answers to above are satisfactory. (6.) Will the vibration on sidecar chassis be too much for an electric bulb?—G.H.

(1.) Intermittent. (2.) No, no damage is done. (3.) If no choking coil is inserted in the circuit no current is produced in the secondary winding. The power of the spark is slightly affected, especially at low speed, even when a choking coil is used. (4.) No; above a certain number of revolutions the voltage hardly alters. (5.) If no choking coil

is used a lamp of about six or eight volts is necessary. If, however, a choking coil is used, so that ignition can take place at the same time, a bulb of about two volts or less is usually used. (6.) No, the vibration, unless very excessive, should not damage the filament of a good make of lamp.

**READER'S REPLY.****Wanted, a Foot Warmer.**

It may interest "W.J.H.," even if it is no new thing, to know that an ordinary oil tin makes an excellent foot-warmer for the sidecar. My own method is to take an empty half-gallon Mobiloil tin fitted with the large tin stopper (not the small brass stopper as is usually fitted to the B. and K. grade tins). Cut a rubber disc which is large enough to just fit the opening, fill the tin with hot water right up to the top; in fact, fill it until the rubber is resting on the water as well as the tin flange. I then screw in the stopper as tight as I can with my fingers, and, as a general rule, the joint is watertight; but, if it is not, a very little turn given with any kind of lever is sufficient to make a good joint. I then wrap up the foot-warmer in anything that comes handy—an old sack, or bit of carpet, or a piece of flannel. One of the reasons for using a covering is to prevent injury to boots in case the water is too hot; also the heat is retained longer. I may say the weight of the tin, including water, is exactly 6 lb.—H.H.

**EXPERIENCES WANTED.**

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"L.N.P." (Birmingham).—2½ h.p. 1915 Enfield, also 2¾ h.p. Douglas for sidecar work. Reliability, speed, and consumption.

"F.J.K." (Castleblayney).—5 h.p. 1915 spring frame Bat, 4 h.p. 1915 A.J.S., and 3½ h.p. 1915 Sunbeam. Reliability and consumption.

"E.A." (Birmingham).—1916 Enfield combination, with Lucas electric lighting set. Reliability, durability, consumption, and speed.

"S.J." (Devon).—Binks carburetter for 6 h.p. Enfield-Jap; also Binks spirit. Power, consumption with sidecar, effect on engine, and efficiency.

"V.N.G." (London).—Carden two-seater, or monocar. Speed, consumption, springing, and wear of tyres.

**RECOMMENDED ROUTES.**

BEACONSFIELD (BUCKS.) TO CROUCH END (N. LONDON).—W.T.

Beaconsfield, Gerrard's Cross, Uxbridge, Ruislip, Eastcote, Pinner, Harrow, Kenton, Hendon, East Finchley, Muswell Hill, Crouch End.

NEWCASTLE (STAFFS.) TO PEMBROKE DOCK.—A.L.

Newcastle, Market Drayton, Hodnet, Shrewsbury, Bishop's Castle, Clun, Knighton, Kington, Willersey, Hay, Brecon, Llandovery, Llandilo, Carmarthen, St. Clears, Pembroke.

A DESPATCH RIDERS' FOOTBALL TEAM BEHIND THE FIRING LINE IN FRANCE.

Many motor cyclists will be recognised from the following list of names:

(Top row) Sapper Bartleet (referee), Cpl. L. Maxwell, Cpl. G. Maxwell, Sgt. O. L. Summers, Cpl. J. Bones, and Cpl.-Art. L. G. Sims.

(Middle row) Cpls. A. E. Crampton, G. Woodman, N. Sims (hon. sec.), H. Floyd, and N. E. Hellier.

(Bottom row) Cpls. L. Alexander, J. E. Hudson, F. C. Allen (capt.), J. White, and E. D. Osgood.

The men have to thank Messrs. Douglas Bros. for the jerseys and ball.

## Average Prices — of — Second-hand Machines.

**W**E give below the average prices of second-hand models offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model the average for the past week is quoted. If there were not at least two advertisements, then the last average is given.

### Australian made Tyres.

**T**HE Dunlop Rubber Co. of Australia has completed at Melbourne what is claimed to be the finest tyre-producing plant south of the Equator. The mills provide employment for 1,400 hands.

### Government Work and Private Overhauls.

We are informed by Messrs. Auto-Wheels, Ltd., that owing to a very much reduced staff, and to the fact that they have important war work on hand, they find it impossible to undertake overhauls at the present time. Any Auto-wheels sent to this firm for this purpose have either to go into stock or to be returned to the customer.

### Australian Road Records.

Last week we chronicled new road records made in Victoria by the American rider, Erwin G. Baker, on a Power-plus model Indian. In the 1,027 miles record, which was covered in 21½ hours, Baker's engine, we are informed, was lubricated with Wakefield's Castrol.

### An Ingenious Windscreen.

To prevent misunderstanding, we are asked to state that the Curry and Pitcher adjustable screen, illustrated on page 78 of our issue of January 27th, is made by the Watsonian Folding Sidecar Co., Ltd., of Conyhere Street, Birmingham. The design has been provisionally patented.

### A Government Permit.

J. E. Brown, 38, Herbert Road, Plumstead, the manufacturer of the well-known Jebron magneto contact points, informs us that he has received a Government permit to supply platinum rivets and screws on condition that they are used either directly or indirectly as war material.

### Reviews.

"The A.B.C. Guide to Patents for Inventions."—R. E. Phillips and A. M. Flack; Phillipps, 70, Chancery Lane, W.C. An exceedingly useful publication, the chief merit of which is the grouping of the matter contained therein, in paragraphs arranged under alphabetical headings, so that the desired information on any particular point can be found with the minimum amount of trouble.

### Rudge-Whitworth's London Manager.

Mr. E. M. Mayes has resigned his position as London manager of Messrs. Rudge-Whitworth, Ltd., after nearly twenty-two years' service with the company, owing to health considerations. Mr. Mayes will be well known to Brooklands habitués, as he always "fathered" Rudge track interests, and, needless to say, he is even better known among trade men. His place is being filled by Mr. T. H. Mobbs, until now at the R.W. Tottenham, Court, Road depot.

### Catalogues Received.

We have lately received a new catalogue of Messrs. The Metropolitan Machinists' Co., Ltd., 248, Bishopsgate, E.C., which includes all the latest accessories and their prices. It is a publication of general interest to motor cyclists.

We are in receipt of the 1916 edition of Willing's Press Guide, Messrs. James Willing, Ltd., advertising contractors and publishers, 125, Strand, W.C., 1s. This book contains a list of practically all the newspapers and periodicals printed in the United Kingdom, arranged in alphabetical order, together with name and address of publishers, price, and day of publication (if not daily). It also gives the names of the principal Colonial and foreign newspapers, and their London addresses. It concludes with a useful list of reporting and telegraphing news agencies.

### Over-size Kempshall Tyres.

The new over-size Kempshall non-skid 700 x 85 mm. tyre is designed to fit 650 x 65 mm. rims. It will be noticed from the illustration that an improvement introduced this year consists in making the beads so that they overlap. This forms a perfect nest for the tube, and prevents nipping. This tyre is now made up with five plies of canvas, and is very strong.

### An Electrical Exhibit.

Messrs. Ward and Goldstone inform us that, in spite of their factory being at present under Government control and on war work, they have been granted special permission to exhibit a large number of their articles of manufacture, which consist principally of such goods as were made almost entirely in Germany before the war, at the Board of Trade exhibition, which will be held from February 21st to March 3rd in the Victoria and Albert Museum. These articles will be a large range of electric pocket lamps, torches, spare batteries, hand lamps, and electrical appliances for the car and garage. Their stand number will be A16.

### A New Year's Day Company.

Messrs. C. A. Vandervell and Co., Ltd., ask us to state that although Mr. Vandervell has turned his Acton business into a limited company of £350,000, there will be no issue of shares to the public, the business remaining as before, solely a "one-man show." With the exception of a few shares, the whole of the capital remains in the hands of Mr. Vandervell himself, the sole founder and proprietor of the business.

## MOTOR CYCLES FOR SALE.

## Alldays.

**ALLDAYS** Matchless, 2½ h.p., 2-stroke, lamps, accessories, good tyres; £20, or nearest offer.—111, Grove Lane, Camberwell. [X191]

**ALLON**—Every model of these wonderful machines actually in stock at the Colmore Depot's London Agency, 44, Finsbury Pavement, E.C. [X791]

**ALLON**, 1916, 2½ h.p., 2-stroke, 2 speeds, and clutch; £35.—Eastern Garage Co., 418, Romford Rd., Forest Gate, E. Phone: East Ham 490. [X2300]

**ALLDAYS** Allon, Nov., 1915, makers just fitted 1916 brakes, etc., head and rear lamps, only done 300 miles: £35.—Lt. Thomas, 53rd W.D., A.S.C., Seaford. [X2122]

**NEW Allons**, 2-speed models £42, single-speed models £34; delivery from stock; cash or extended payments.—Wauchope's, 9, Shoe Lane, London. [X2199]

**ALLON** 2-stroke, 2½ h.p., late 1915, complete with 2-speed, F.R.S. rear light, horn; cost £48/6 in all, will accept £34.—Swainbank, Boulton Lane, Wood End, near Atherton. [X2066]

**ALLDAYS** Matchless Combination, late 1914, 3½ h.p., countershaft, 3-speed, kick starter, foot clutch, underslung coachbuilt sidecar, nearly new tyres, all chain drive, all accessories; bargain, £40.—64, Mill Lane, Brixton Hill. [X2282]

**1916 Alldays** Matchless, 6-h.p., 3 speeds, chain drive, latest Millford Empress sidecar, hood, screen, side curtains, tyre carrier, Autoclipse lamp, solid aluminium rear light, Corbin speedometer, Lucas horn, all absolutely as new; cost £109 only few weeks ago; owner called up; best offers.—H. S. Purcell, Audlem, Cheshire. [X9937]

## Ariel.

**ARIEL** combination, 5-h.p., countershaft, handlebar control, just delivered; £94.—Dan Guy, Weymouth. [X1077]

**ARIEL** Lightweight, mag., B.B. carburettor, excellent condition; accept £6/10.—E., 208, Camberwell Rd., S.E. [X1059]

**1913 Ariel**, 3-speed, 3½ h.p., and sidecar, in perfect order; £35; easy payment arranged.—Jones, Garage, Muswell Hill, N. [X1207]

**3½ h.p. Ariel**, in grand running order and condition; £22.—Particulars, George Baniabridge, Front St., Witton, Gilbey, Durham. [X2058]

**1916 Ariels**, 5-h.p. and 3½ h.p. combinations actually in stock; ladies taught free by lady tutor; deferred payments arranged.—Ariel Special Agent, Jones Garage, Muswell Hill, N. [X1206]

**ARIEL**, 1916, all models actually in stock; trade supplied; special deferred payments if desired; liberal exchanges.—Lamb's, 151, High St., Walthamstow, and 50, High Rd., Wood Green. [X1174]

## Aroo.

**3½ h.p. Aroo** Combination, 1913, good order, new tyres £2 and belt; bargain, £22/10.—18, South Bruton Mews, Bond St., W. [X9918]

**SMART** Combination, 1914 3½ h.p. Aroo, 3-speed, canoe sidecar, well upholstered, lamp, horn, Senspray; 38 gns.—Railway Garage, Staines. [X1240]

## Auto-Wheels.

**UTO-WHEEL**, good condition; £5/15.—Mrs. Gidley, 37, Furzehill Rd., Plymouth. [X1194]

## Bat.

**BAT-J.A.P.** 1915 Combination, 6 h.p., mag., 3 speeds; £58/10.—1, Esher St., Wandsworth. [X2265]

**BATS**, 1916 4 h.p. twins, new 2-speed gear and free engine models; £60/7/6; delivery from stock.—Wauchope's, 9, Shoe Lane, London. [X2218]

**BAT-J.A.P.** 1912, 8 h.p., free engine, splendid condition, smart appearance, recently enamelled and plated; £26; genuine.—Cater, St. Cloud, Amersham. [X3596]

**BAT** 1915 4-h.p. Twin, 2-speed countershaft gear, chain-cum-belt drive, brand new; list price £60/7/6; special price for cash, £55.—Elice and Co., 15-16, Bishopsgate Ave., Camomile St., E.C. [X0598]

**8-10 h.p. Bat-Jap**, 1912, spring frame, special racing model, overhead valves, new Palmer cord, 2 belts, very fast and powerful, perfect condition; £28, lowest.—Reid, Sunnyside, Lightcliffe, Halifax. [X2307]

## Bradbury.

**BRADBURY** 1916 Models.—Agents, Bright and Hayles, 73, Church St., Camberwell Green. [X1093]

**1914 Bradbury** Combination, 4 h.p., splendid condition; £40, or offer.—4, Grove Green Rd., Leyton. [X1192]

**BRADBURY**, 4 h.p., 1913, 2-speed and free engine, accessories, excellent condition; £28.—A.J.E., 11, Looe Rd., Sevenoaks. [X1936]

**BRADBURY**, 4 h.p., was new 1913, free engine, 2-speed, R. gn. Canoe sidecar, screen, lamps, speedometer; £29.—69, Hamburg St., Spitalfields. [X1156]

**BRADBURY**, 1912, 3½ h.p., 2-speed, head lamp, back lamp, horn, and Cowey speedometer; £27.—Eastern Garage Co., 418, Romford Rd., Forest Gate, E. Phone: East Ham 490. [X2293]

**BRADBURY**, 1914, 6 h.p., 3-speed combination, hood and screen, Lucas accessories, 63 gns.; also 1912, 3½ h.p., 2-speed, with aluminium sidecar, all accessories, 35 gns.; special deferred payments if desired.—Lamb's, 151, High St., Walthamstow, and 50, High Rd., Wood Green. [X1177]

## CORONET Sidecar Chassis

is designed for long life, and has a wonderful reserve of stability, and is safe on greasy roads. Luggage carrier built into frame. Cannot shake loose, and is a boon when touring.

£10 15s.

Send for illustrated catalogue describing these well known Sidecars.

EXCHANGES.

TRADE SUPPLIED.

We can give immediate delivery of all models, and suitable for any make of machine.

## Coronet Sidecars for Harley-Davidsons.

We make a special Sidecar, enamelled French grey to match, 28 x 3 in tyre, apron to cover entire body, and 4-point attachment ..... £13 10 Immediate Delivery.

## 7-9 h.p. HARLEY-DAVIDSON.

11J, electrically equipped, 3 speeds ..... £76 13  
11F, standard 3-speed model ..... £68 5  
1916 models also in stock.

## NEW 1916 FORDS.

5-seater Touring Car ..... £135  
Delivery Van ..... £130  
Motor cycles taken in exchange.

## SPECIAL BARGAINS.

7-9 h.p. HARLEY-DAVIDSON, 3-sp., with coach Sidecar to match ..... £75 0  
6 h.p. A.J.S., 1915, lamps, horn, speedometer, etc. .... £68 15  
4½ h.p. STAR, brand new big single, 3-sp. countershaft gear, chain drive, kick starter; listed at £68 5s. .... £55 15  
3½ h.p. LEA-FRANCIS, 1915, nearly new, 3-speed, kick starter, Hercules £13 13 Sidecar, £5 5 speedometer, £3 10 lamp set; the whole cost £94 10 ..... £65 0  
2½ h.p. WOLF, 1916, 2-stroke, 2-speed ..... £33 10  
4 h.p. WOLF, 1916, 3-speed, chain drive. .... £49 15  
2½ h.p. LEVIS, 1915, 2-stroke, 2-speed ..... £25 15  
3½ h.p. HUMBER, 1914, 3-speed model, with Sidecar. .... £39 15  
3½ h.p. PRECISION, 1912, nice condition. .... £16 15  
1913 HUMBERETTE Cycle Car, hood, screen, electric lamps, 3 speeds and reverse, good tyres ..... £47 15  
3½ h.p. RUDGE, 1912, free-engine model. .... £19 15  
4 h.p. QUADRANT, 1912, 3-speed model ..... £20 15  
3½ h.p. SINGER, 1912, 3-speed model, with cane Sidecar ..... £25 0  
3½ h.p. SINGER, 1912, 3-speed gear ..... £22 10  
3 h.p. HUMBER tricar ..... £5 5  
1½ h.p. WOLF, 1912, magneto ..... £9 10  
4½ h.p. JAMES, 1914, 3-speed, with James coach Sidecar ..... £48 15  
3½ h.p. P. & M., 1911 model, with coach built Sidecar ..... £31 10  
1915 MORGAN, 700 x 80 tyres all wheels, lamps, horn, hood, screen, speedometer, etc. .... £89 0  
2 h.p. CALTHORPE Lightweight, 1914, 4-stroke model, countershaft 2-speed, nice order ..... £17 15  
3½ h.p. PREMIER, 1911, B.S.A. 2-speed. .... £19 15  
1915 TRUMBULL Light Car, hood, screen, detachable wheels, speedometer, electric horn and lamps ..... £99 15

## MISCELLANEOUS.

New Cane Body, open type; cost 35/- .. 10/6  
New complete Sidecar Chassis ..... £3 5  
New Underslung Sidecar Chassis, complete Wicker Sidecar Bodies; to clear ..... 3/6  
New Coach-built Body, side door ..... 57/6  
Brand New Waterproof Magneto ..... 70/-

## Those Springs

—the Springs of the famous **DRUID MARK II**.—mean all the difference between a complete and part Efficiency—between your complete comfort and satisfaction and partial comfort and dissatisfaction.

Bear well that fact in mind, and, whether 1916 will find you riding new machine or old, see to it that the Fork fitted is the

## DRUID MARK II

—the ONLY Spring Fork which embodies the CORRECT "Design-principle"—the ONLY Fork which totally absorbs WITHIN ITSELF every kind of shock both Vertical and Horizontal, and the ONLY Fork which will ensure your continuous comfort under all road conditions.

Ask your Agent about the DRUID—or us direct for full particulars.

### All Work and No Play.

**T**HE climax to the agitations of the busy bodies who have been at work of late urging the suppression of motoring was the issue of a protest last week by the National Organising Committee for War Savings, appealing to motorists to cease the use of motor cars and motor cycles for pleasure. It is actually cited as a reason for abstention that the poorer classes cannot be urged to save so long as they see well-to-do people enjoying "an expensive luxury."

We wonder if the National Organising Committee have taken the trouble to find out what amount of pleasure motoring is indulged in at present? So far as motor cycling is concerned, if it exist at all, it is only to a very small extent at week-ends, and then mainly by busy munition workers. We discussed the subject a month ago on this page, and we argued that a motor cyclist had a perfect right to decide whether he should spend a couple of shillings on petrol (sufficient for nearly 100 miles) to bring him health and vigour after a hard week's work, or whether he should relinquish the use of his motor cycle and spend more in visiting a stuffy theatre or picture house. This is the extent of the "thoughtless extravagance." But who is to decide what is pleasure motoring? And why should motoring be selected when the hundred and one other amusements—many less desirable—are allowed to continue as of yore? A run on a motor cycle is health-giving, invigorating, and a necessary stimulant to jaded workers. If motor cycles were not largely used by professional and business men, and if they were to be seen on the road in the hands of obvious pleasure-seekers in any numbers during the week, we should not take up this attitude. But when it is remembered that every man at home to-day of military age is engaged in an occupation in the nation's interest, or, if not, will in the near future be serving in H.M. Forces, the recommendation, to say the least, is untimely, for every sensible man to-day practises economy.

Long hours are the rule nowadays, and excess work necessitates an occasional week-end change. We cannot see how the National

Organising Committee can consistently cite motorists as an evil example to the so-called poorer classes when Cabinet Ministers and M.P.'s continue to vote themselves their full salaries, and retired Ministers receive their full pensions, and not only so, but practically announce their decision to continue to take them. Besides, the recommendation is weak. If, as would appear from the appeal, a leading object is to stop imports of motor cars and motor cycles, then why not do so, instead of continuing to talk about it? It is no fault of anybody's but the Government's that millions of pounds worth of motor cars and motor cycles have come into this country during the last eighteen months. The recommendation to cease pleasure motoring—if it existed to any undue extent—would only be heeded by the conscientious, which is very unfair. Motorists are already taxed heavily enough. But what if motoring were to cease altogether? Has the National Organising Committee taken into consideration the hundreds of thousands of pounds received annually in registration fees, local taxation licences, and driving licences for the use of vehicles, and the thousands of pounds in duty on petrol? How is it proposed to make up the deficit? It is typical of Government announcements to beat about the bush instead of giving a real lead, and we regard the recommendation as feeble in the extreme, citing as it does the number of ships and men employed in carrying oil and rubber, the men on the docks, railwaymen, and men employed in handling the cargoes, etc., when, as we have said, the fault is no one else's than the Government's. It is within their power to have adopted the *via media* and months ago prohibited imports of all the luxuries and the so-called luxuries if the need were pressing. As regards motor cycles, their owners almost invariably being men of limited leisure, we question the feasibility of further reducing the trivial amount which they expend on their hobby in preference to theatre, club, golf, or whatnot. "All work and no play makes Jack a dull boy." A reasonable amount of purely recreational motor cycling should not be discouraged till every other form of less healthy recreation has been utterly suppressed.

# MILITARY NOTES.

## A DESPATCH RIDER'S VARIED EXPERIENCES.

### TWELVE MONTHS' DESPATCH RIDING. FROM FLANDERS TO SALONIKA VIA EGYPT.

SOME of the experiences and wanderings in different parts of Europe by a section of despatch riders attached to a certain signal company are recounted in a letter we have received from Cpl. C. Clayton-Parrott, himself a member of the section referred to. Parrott has recently been awarded the D.C.M., upon which he is to be congratulated. The signal company to which our correspondent is attached went on active service in January, 1915, since when excitement and hard work have been experienced in different parts of Europe and Africa.

"We were" (writes Parrott) "for some five months in the Ypres district, and it was here during the second battle for that ill-fated city that we D.R.'s came in for our full share of shell fire and gas, etc. We had four of our number wounded, and five or six put out of action from accidents or illness due to motor cycling. Cpl. Ball was one of those wounded; he has since received the Russian Cross (Third Class), and no man ever deserved an award more than he did.

"The photograph shows our whole company, with the exception of our sergeant and artificer, who do not often ride, and Cpls. C. Walker and Harry Drury.

"Our next big move took us to a much quieter part of the line on the borders of France and Belgium. From there we were packed off in a hurry to back up the attack on Loos in September, and whilst there saw enough mud to last us a lifetime. Our brigade H.Q.'s were very advanced and reached only by walking up narrow and muddy communication trenches. We used to look pretty sights on our return from a brigade run covered with mud.

"From there we were destined for a long distance move, as after three or four weeks (including two of the best spent

in Marseilles) we found ourselves in Egypt, enjoying sun baths and dips in the sea—very nice, too, for mid-November, but it was too good to last long—although from a motor cycling point of view we had a fairly rough time, much walking having to be done over the loose sand.

"We again embarked on ships, and eventually landed at Salonika, where we are at the present, camped some three or four miles outside that impossible town. I say impossible, as the roads or streets are too awful for words. We used to grumble at the *paré* in Belgium, but Salonika beats all records in this respect. The setts or granite slabs are about two feet square, and may have been level once, but now seem to be on a two or three inches different level, and in many cases as much as six inches. The tram-lines, too, stand up off the road like railway lines.

"Our camp is at present in the hills and only reached by mule tracks, so that except for runs to the town our bicycles are not much use, so we have been issued horses as well. It is not often Douglasses jib; we have put them to the severest tests, and they have always come out trumps; but mountain passes strewn with boulders and pieces of rock are a bit too much for the faithful mounts. I should also like to say a good word for Dunlop tyres. One man has only had one puncture, and both tyres are good for a few more months. He joined us eight months ago.

"I should like to mention that Cpls. Price, Westall, Curry, Hinchcliffe, and Thompson, after being attached to our company for many months, being regulars for the duration of the war, were compelled to leave us, so remained at Alexandria—some of them got sent to the Dardanelles. Our C.O., Major Saunders, has been twice mentioned in despatches and awarded the D.S.O. and Lt. C. Woodburn Kirby the Military Cross. Both officers are keen motor cyclists in peace times."

Belgian despatch riders, Cpls. Maurice Hélas and Michaux, who ride James machines. Both men have had the same mounts (a single and a twin) since the early days of the war, and speak very highly of the manner they have stood up under active service conditions.

### MOTOR FLEET OF THE QUAKERS IN FRANCE.

THE good work of the Quakers behind the firing line in France is not known as it should be. It consists mainly in rebuilding farm houses and cottages of the poorer classes who suffered so severely in the advance of the Germans through north-east France in the early days of the war. Thousands of refugees have been refitted with clothing, seeds for the poor farmers have been supplied, and help given in the ploughing of the land where the husband is away on active service.

An important part of the equipment of the Society of Friends in this work is a fleet of motor vehicles totalling thirty-two. Of this total there are five motor cycles, all Douglasses. One of our readers, Frank P. Woolmer, has had charge of the repairs of this fleet, and as the cars are of many various makes it has been no light undertaking. However, all have been overhauled during the winter months, and now are on the road doing good and important service in a variety of ways.

### A PIONEER ARMY MOTOR CYCLIST.

WE recently had a visit from Capt. A. H. Trapmann, who was one of the most energetic of pioneer army motor cyclists, being one of the earliest officers of a territorial regiment to impress upon the War Office the future value of the motor cycle in warfare. He was some time military correspondent to *The Motor Cycle*. Since the present war Capt. Trapmann has seen no active service, but previous to that time he saw much fighting in the 1913 Balkan campaign with the Greek army. He is now shortly sailing for the East, and we wish him the very best of luck.

SOME DESPATCH RIDERS WITH THE SALONIKA FORCES.

From left to right: Cpls. C. Clayton-Parrott, D.C.M., L. R. Evershed, P. W. Austen, L. H. Elliott, and F. H. Bensted. All are mounted on Douglasses

### Dry Roads.

East winds have their drawbacks, but their first withering blasts in spring contain a secret thrill for the present scribe. After months of perilous slithering (ugh!) on a wheezy, crawly little baby two-stroke, to get out the big T.T., tuned to the nick, during winter slime, to take it out knowing that the surfaces are safe and hard, to open the throttle, and eat up ten or twenty miles of road, is well worth the subsequent agony of recovering one's circulation by a huge fire. And so say all of us!

### A Change of Kit.

Quite a lot of my riding is of the three stops a mile order, and at some of my stoppages convention demands that I should not enter the house or office with my nether extremities shapelessly swathed in a pair of overall leggings, the lower eighteen inches of which resemble a half-prepared asparagus bed in everything but the presence of the proverbial semi-decomposed donkey. When the days are not cold, I have modified the get-up by wearing riding breeches and well-polished gaiters, the sheen of which might be restored by a wipe over with a large mutton cloth stored for that purpose in my head lamp. But one day this winter my business delayed me long past nightfall, so the mutton cloth had to come out of my lamp, and, as I am an absent-minded beggar, it went into a side pocket. An hour later I tramped into Mrs. Ixion's boudoir, eying her nervously, blowing my nose vigorously, as a cover behind which I might think out a new lie to account for my tardy return. (No, I am *not* a favourite of the new barmaid at the King's Head!) Suddenly I caught her expression; "bristling" was the best word for it. She advanced, majestic, stupendous! Seized the tongs. Rescued from her boudoir floor my mutton cloth, which had become dislodged, as I stuffed my greasy gloves away. "'Ixion,' what is this?" It is ashes now. Next day I bought some spring-sided patent leather gaiters, which I can whip off when I want to do the dandy at a call; and to keep—well, the upper halves of my nether extremities—cosy in an English spring, I wear beneath the riding breeches [Remember our lady readers, Ed.]—well, they're made of Jaeger-Arctic grade, gentlemen! The sum total is neater than overalls, quite as warm, easier to put on, easier to take off, less liable to rip; and in the event of a heavy storm, there are my trusty Beacon oilies strapped to the carrier.

### Maladjusted Overhead Inlets.

A novice complains that I am growing too technical, and that I never write in words of one syllable nowadays. Remembering my own salad days, let me now distil simple wisdom anent overhead inlets,

especially in view of a problem on the subject recently set us by a reader. If the clearance at the rocker of the valve is allowed to grow excessive, the normal symptom is a considerable loss of power. On the one hand, the inlet valve cannot open as much as it was designed to do, so that a full charge cannot be inhaled; on the other hand, it opens later than it should, which further weakens a willing engine. The correct adjustment is that there should just be clearance, and no more, when the engine is hot.

### A Good Two-stroke Carburetter.

Carburetter design has a marked effect on the running of small two-strokes; one always knew, of course, that they were sensitive to carburetter adjustment. I had made every conceivable experiment with a certain baby, and its running was still unsatisfactory, especially in respect of starting, acceleration, slow running, and petrol consumption—four rather vital points. As a last resource I fitted a B. and B. baby carburetter, and was astonished to find that its running was transformed, though the test was made with the setting selected as standard by the makers. The engine now starts in a yard or so, even when cold, and usually fires before the back wheel is out of the shed. The acceleration is terrific. The slow running is perfect, except that there is still a little misfiring in sudden slowings down; and the fuel economy has improved nearly 20%. I must not plunge into unjustifiable generalisations, and infer that similar improvements would be sure to follow with any other engine; but the baby B. and B. certainly gives far better results with my present engine than either of the carburetters previously fitted to it.

### Baby Two-strokes up Freak Hills.

While I am on two-strokes, I wonder what is the worst hill climbed by readers on standard baby two-strokes? I am sure the Editor will be glad to print a few brief letters, giving particulars of engine, c.c., gears, name and locality of hill, etc. I ask the question because I am beginning to doubt whether the average baby is geared quite low enough for really atrocious hills. It is up to ordinary main road work, *sans doute*, even in the hillier counties. But—pardon the terrible confession—I actually had to push up a frightfully steep bylane the other day. My engine had always had loads of power in reserve on the Midland hills, and I snicked in low gear quite happily when the aforementioned steep hove in sight, only to jump off and run ineffectually about halfway up. If this is a normal occurrence with babies on really bad hills, some of our rural residents must be privately pressing the factories for lower emergency gears. The baby is indubitably the handiest machine in the world for winter lane work; and it will be in good demand for such jobs

## Occasional Comments.—

when the war is over, provided it can manage the hills satisfactorily. If a lower emergency ratio is required, the factories will need some warning. It would have to be an option, as existing gears are low enough for at least 60% of the users; and there is not always clearance in the lilliputian gear boxes for a low gear-driven pinion of larger diameter, whilst the introduction of a three-speed box will send up both price and weight.

**A New Braking Idea ?**

I recently asked a manufacturer whether he considered his standard brakes were powerful enough for all emergencies. He answered with a frank negative. Like most practised hands, he is a profound disbeliever in front wheel brakes, and only fits one because of the stupid law on the subject, taking care to prevent its being really efficient, and never using it at all in his own riding. At the same time he considers it inadvisable to fit a tremendously powerful rear wheel brake, though it is a simple matter to do so. The rider who has not mastered the niceties of driving—and many riders never master them—is prone to stamp with full weight on the brake pedal at the least suggestion of approaching danger; and such procedure will cause at least as many accidents as it will avoid. Consequently he designs his rear brake so that it shall possess good stopping power, but just fails to lock the wheel suddenly under abrupt application. All this is sane and well-reasoned

practice as far as it goes, but it still leaves the question, "What is the rider to do in urgent emergencies, when abrupt and almost instantaneous pull-ups are the only alternative to disaster?" My mentor solves this by fitting a gear box with an absolutely foolproof change. Provided the clutch is withdrawn, you can change from any gear to any gear on this machine, without the least attention to engine speed, pauses, or other normal dodges for silent gear changing; and the change will never be noisy. All his customers are advised to rely on gear changing as their normal method of braking; and when an emergency arises,

an instantaneous stoppage can be engineered by slamming in a low gear and using the rear brake at discretion simultaneously. As some readers are aware, this dodge has been widely employed in the T.T., where it also renders acceleration an easy matter.

**Riding Through Sand,**

Will some friendly Yank or other overseas rider kindly present me with a few hints on riding through deep sea-blown sand? Is it possible, and, if so, what is the trick? Approaching some strange golf links the other day, I was much nettled by my opponent's contemptuous advice to leave my bicycle and walk the last half-mile. On enquiring into the nature of the obstacles, I was countered with the one ominous word "sand." Much goodly coin of the realm was finally staked on the issue, and I started. I made several heroic attempts, but one sandy gully floored me every time.

**THREE UNUSUAL AMERICAN DESIGNS.**

(Top) The Dayton lightweight, in which the motor is located in the front wheel. The footrests are attached to the end of the front forks, and so move with the wheel.

(Middle) Latest model of the Militaire—the nearest approach to a car.

(Bottom) The Cyclomotor, a lightweight attachment.

# THE AERO ENGINE.

## HOW WAR-TIME DEVELOPMENTS MAY HELP MOTOR CYCLE DESIGN.

(Continued from page 603, December 16th, 1915.)

**T**HE previous article on this subject concluded with some general remarks about the 50 h.p. Gnome engine, which, it was explained, was the first practical engine to be produced in any quantity, and to which one of the greatest advances in aeroplane construction was undoubtedly due. It may be of interest to trace onward the subsequent types of Gnome engines. The seven cylinder 50 h.p. Gnome had a bore of 4.35in. and a stroke of 4.73in., and its weight in pounds per b.h.p. was approximately 3.4. There was also a seven-cylinder 60 h.p. engine, the bore and stroke of which were 4.73, the weight per b.h.p. being 4.2 lb. The seven-cylinder 80 h.p. engine had a bore of 4.88in. and a stroke of 5.52in., the weight per b.h.p. being 2.6 lb. Later there was a 100 h.p. nine-cylinder engine with a bore of 4.88in. and a stroke of 5.9in. weighing nearly 3 lb. per b.h.p. The foregoing engine also were doubled, that is to say, there would be two rows of seven cylinders and two rows of nine cylinders, so that there was a fourteen-cylinder 100 h.p. engine, a fourteen-cylinder 120 h.p., a fourteen-cylinder 160 h.p., and an eighteen-cylinder 200 h.p. engine. Very few new machines are built nowadays for use with a 50 h.p. Gnome engine, the favourite sizes being the 80 and 100 h.p., although the use of these appears to be limited latterly. The bigger-engines, of course, are also in demand.

The front of the Deperdussin racing Monocoque, showing the way in which the Gnome engine is covered in with a cowl to reduce the head resistance without detriment to the cooling capacity. This machine covered 124 miles in 1h. 9m.

When it is said that the 50 h.p. Gnome is not often built into new machines nowadays, one is perhaps erring a little, because it was on a little machine (nick-named the "Sopwith Runabout") built by the Sopwith Company, equipped with a 50 h.p. Gnome engine, that Mr. Hawker, the well-known pilot, recently

achieved a feat which has been spoken of and secretly aimed at for years past at Brooklands, that is, flying under the Byfleet foot bridge over the track. In the course of a conversation with the A.B.C. Co. the other day I was told that the engine which Hawker then

Front of a Royal Aircraft Factory experimental biplane fitted with a rotating cylinder engine provided with a cowl to reduce head resistance. This machine exceeded 130 miles an hour.

used is very probably the No. 11, one which they sold to Sopwith's years and years ago. The writer rather chuckled at this, because he recollected a jest or fable that used to go round the Brooklands clan in the early days, to the effect that, after a bad smash on the part of someone, whose name he cannot just remember, A. V. Roe bought, very cheaply, a 50 h.p. Gnome engine in a damaged condition. When he came to inspect it he found that one of the cylinders, which, of course, are remarkably thin and very easily damaged, had become bent a trifle oval, so that, the tale runs, "A.V." eventually got the piston out, put it in a vice, and bent it oval to match, and then put it back again. After that I believe it got into the hands of the A.B.C. Company. Furthermore, a 50 h.p. Gnome once put in a Sopwith-Wright biplane blew off one of its cylinders whilst the machine was in the air, and the cylinder went clean through the top plane. However, that is a digression.

### The Air-resistance of Revolving Cylinders.

One of the faults of the Gnome engine, from an aeronautical point of view, is its very considerable head resistance, and also the power required to turn the cylinders round against air resistance. At first the engines were allowed to run exposed completely to the

**The Aero Engine.—**

air, it being thought that this would be necessary to ensure the supply of cooling air. However, it was eventually found that the engine might be enclosed almost entirely, with a comparatively small space left for air to enter at the centre of the cylinders, and to escape at any convenient point, generally beneath the front of the machine. Two illustrations of this cowling are given, one being the method utilised on the original racing Deperdussin Monocoque, which covered 124 miles in 1 hour 9 minutes for the 1913 Gordon-Bennett Cup, the other being the front of an experimental machine produced by the R.A.F., said to be capable of a speed of 130 m.p.h. This point is mentioned to give some idea of the importance of streamlining where speed is concerned. Another important effect of this cowling was to prevent the unburnt castor oil, which used to issue in a fine stream from the exhaust valves of the cylinders, from coating the planes, the tail, and the pilot with a sticky mess.

There is no question that one of the bugbears of the Gnome engine was the automatic inlet valve in the piston, as this device was a delicate one, and one that was necessarily put to considerable hard work. The springs required much attention, and it was essential to the sweet running of the engine that the tension of all the springs should be approximately equal. Added to this, of course, the automatic valve was abandoned for most other kinds of petrol engine work years since as inefficient. Nevertheless, there are very many people who hold to this day that part of the initial success of the Gnome engine was due to the fact that the cylinders and pistons are internally cooled by the incoming mixture from the crank case.

**A Four-stroke Engine with Transfer Ports.**

Be that as it may, however, the Gnome Co. produced some little time before the war an entirely new engine on a somewhat different principle, having only a single valve, and that an exhaust in the cylinder head. This engine is known as the Monosoupape, and a diagram of it is given on the next page. Substantially the arrangement of the engine is the same as that of the original two-valve type, and the mixture is again fed into the crank case, or, rather, one should say that air is drawn in through the hollow shaft and nose piece of the engine, and through the timing end of the crankshaft, where it picks up petrol which is supplied by a small force pump to a jet placed in the forward web of the crankshaft. The mixture thus drawn in is extremely rich; in fact, far too rich to ignite in the ordinary way.

The cylinder is made longer than usual, and has close to the lower end a row of ports which are exposed to the interior of the cylinder by the piston when the latter is at the bottom of its travel. These ports are also in connection with the interior of the crank case. The engine works on the four-stroke principle. Supposing that in the cylinder at which we are looking the piston is commencing its downward firing stroke, the large valve in the head of the cylinder is opened early to allow the burnt charge to escape, in which it is helped by centrifugal force. When the piston reaches the bottom of its stroke the ports in the crank case are uncovered, but the timing is so arranged that at that point the pressures within the crank case and within the cylinder are approximately equal, so there is no tendency for a rich mixture to flow into the cylinder. The piston then completes an upward stroke, forcing out the residual contents of the cylinder through the still open valve. At the downward or suction stroke the valve continues to be held open until about one-third of the stroke, and fresh air enters into the cylinder through the exhaust valve. When the latter closes, further motion of the piston taking place, a depression is created in the cylinder, and when the piston reaches the bottom of its stroke, and the ports are uncovered, a super-rich mixture flows in from the crank case and, mingling with the air, is compressed by the upward stroke of the piston ready for firing. The speed of the engine is regulated by varying the timing and lift of the exhaust valves by a link motion. As the petrol is supplied by a force pump its quantity is regulated by the speed at which the engine is running.

A point about the design is that the vaporisation of the petrol takes place inside the crank case, so that the latter gains the fullest advantage as regards cooling, a point which may perhaps be peculiarly useful so far as the lubricating oil is concerned. The Monosoupape engine weighs slightly less per horse-power than the original type. Its speed of revolution is approximately the same.

Of course, the original success of the Gnome engine produced many copyists, and numberless attempts were made to equal or improve upon its performance without originally any success. Within the last year or so, however, considerable progress seems to have been made with the Le Rhone engine, and also with the Clerget. In design both these engines are somewhat similar to the Gnome, although in details they differ considerably. The Le Rhone is now amalgamated with the Gnome Co. The engine has mechanical exhaust and inlet valves in the cylinder head both

The seven-cylinder Clerget rotating cylinder engine, which has mechanical exhaust and inlet valves, and a separate inlet pipe from the crank case to each cylinder.

**The Aero Engine.—**

valves being operated by a single push and pull rod. The mixture is fed into the crank case, and thence is conveyed to the inlet valve of each cylinder head by a separate pipe. For its power the Le Rhone engine is slightly heavier than the Gnome, but is rather more efficient in petrol and oil consumption.

**Other Ingenious Types.**

There are, of course, numberless other types of rotating cylinder engines; some, indeed, in which the cylinders rotate in one direction whilst the crankshaft rotates in another. Many of these designs are very ingenious, but as none of them up to the present time seems to have proved itself successful, it would be somewhat of a waste of space to deal with them. The writer must confess that he thinks those authors of papers or books on the subject of aeroplane engines waste any amount of space and trouble in dealing with engines which, although ingenious, have never proved themselves practical successes. This space would have far better been devoted to full and correct accounts of the existing successful engines, the way in which to handle them, their faults, and the way in which these faults could be remedied. After the war, when all the experience which has been and is being gained can be collected and classified, there is no doubt that an immense amount of most interesting information will be forthcoming. One cannot draw from the mass of information which is already available as it is for fear of assisting the enemy.

There has been, perhaps, in the foregoing, little of direct interest to the motor cyclist, although some attempt has been made to show the limitations of the rotating cylinder engine. Incidentally it may be mentioned that two of the greatest defects of the Gnome and similar engines are, firstly, that they will not run for a period exceeding about twenty-four hours without it being necessary to take them completely to pieces for cleaning and the renewal of various parts, and secondly, such engines upon a slight derangement are liable to stop altogether when in the

air instead of being able to jog along after a fashion. This means that for war purposes they can be hardly satisfactory, save for stunt speed or climbing machines meant for offence or defence behind the lines.

**Air and Oil-cooled.**

Some mention should be made upon the subject of lubricating and of cooling. The oil consumption is very heavy, and the original Gnoms used about one-third of castor oil to the quantity of petrol. This was largely due to the fact that centrifugal force causes the oil to be flung into the cylinder and piston, and, gradually finding its way past the latter, is burnt in the combustion chamber or flung out in a partially burnt state. It has been suggested that the Gnome engine is very largely oil-cooled as well as air-cooled,

and it is extremely probable that there is something in that view, at any rate so far as the cylinders are concerned. The only parts of the Gnome engine which really might be considered to require oil under pressure are the big end and small end bearings of the connecting rods and the cylinders. Owing to the speed of the engine the timing gear should make no special demands, whilst the crankshaft and the master connecting rod bearings are balls which require no lubrication, but merely protection against rust, provided they are up to their load. The Gnome and most other rotating cylinder engines are equipped with steel cylinders, and these on the score of cooling efficiency,

expansion, and lightness. So far as other aeroplane engines are concerned there can be no doubt that the modern tendency is towards the steel cylinder, whether air or water-cooled, and there seems to be little doubt that much of this tendency is due to the pioneer efforts in this country of the Green Engine Co. and the A.B.C. Engine Co., both of which are well-known in the motor cycle industry also, and concerning the products of which there is much of interest to be dealt with in due course.

M.T.

Sectional view of the Gnome Monosoupape engine. The large valve in the head does duty as an exhaust and an air inlet, a super-rich mixture being admitted into the cylinder through ports uncovered by the piston at the bottom of the stroke.

**BRITISH TRADE WITH RUSSIA.**

ONE of the first practical steps to stimulate British trade with Russia and to divert to British concerns the enormous trade heretofore enjoyed with Russia by Germany is the publication of the "Directory of British Manufacturers for the Russian Trade," edited by R. A. Lenski, and printed in the Russian language for circulation in Russia. It is published at 5s., by the Russo-British Trade Exchange, Ltd., 16, Regent Street, W. As regards the motoring

section, we note that motoring firms are not so well represented as they might be, though whether this is due to lack of interest displayed by British motor cycle manufacturers or to lack of initiative on the part of the publishers we are not prepared to say.

The great extent to which British-built motor cycles are being used by the Russian Army should greatly assist manufacturers concerned in obtaining trade in Russia after the war.

# THE SPRING FRAME PROBLEM.

FURTHER DESIGNS IN SUPPORT OF "THE MOTOR CYCLE" CAMPAIGN.

Finality in spring frames is by no means reached at present, and we publish on this and the following page designs which have been submitted by readers. Without wishing to make invidious distinctions we may say that Mr. Addenbrooke's drawing shows much originality, not only in the arrangements for the springing, but also in the triangulation of the frame itself. The American design sent by Mr. L. F. Jones is interesting, as it was seen in use four years ago, but we do not think it brings us any nearer to a solution of the problem.

Suggested spring frame design. See letter on this page from Mr. R. G. Kershaw.

## Semi-elliptic Springs.

Sir,—Having followed with interest the articles and correspondence in connection with spring frame design for motor cycles, I am enclosing herewith a sketch showing an arrangement of spring frame which may appeal to some of your readers.

R. G. KERSHAW.

## Spring Frames with Variable Gear Machines.

Sir,—I have been very interested in the various designs of spring frame shown in *The Motor Cycle*, but have never seen one with which the infinitely variable gear—such as the Gradua—could be used. Has this ever been tried? I enclose a sketch showing one way in which I think it could easily be done.

On the saddle lug are hung quarter-elliptic springs of the usual type, fastened rigidly. Their free ends are anchored to swivelling joints on a U-shaped tube (as in the Douglas and other machines) which, in turn, is free to oscillate about the axle. The usual chain stays at their forward end are anchored to two bell crank side plates which have their fulcrum at the lower end of the saddle pillar. From these the two pulley control rods are taken to the pulley.

To the other end of one bell crank plate is attached an internally threaded sleeve, in which works the threaded gear lever. This lever is kept from rising or falling when it is turned by the steady on the top tube. When the gear lever is turned so as to push the sleeve (and also the

bell crank side plates) downwards the plates rotate, which brings the back wheel forward, the U tube being free to rotate at the point where the springs are attached.

Low gear is obtained by turning the gear lever in the other direction, drawing the arm of the bell crank up, and thus pushing the back wheel further back and also opening the pulley by pulling back the rods. While the gear ratio remains constant the plates remain stationary, all oscillations due to the springing system being taken up by the upper arm, which is in such a position that the belt tension should not be at all affected by the flexing of the springs. Owing to the two sides of the frame being rigidly connected at four points lateral play should be impossible.

The spindle on which the plates are pivoted could have squares formed on the ends, and thus both plates would be rigidly connected; if necessary the plates could be provided with an Autoloc arrangement, which allows the lower side of the cranks to be moved, but renders them absolutely rigid from the upper side. A spring carrier could also be used

NORMAN FORSTER.

## An American Idea.

Sir,—In view of the prevalent interest in rear springing for motor cycles, you may consider the accompanying illustration worth reproduction. It depicts the spring frame fitted to the Minneapolis machines about four years ago, and its working needs no explanation.

The springing question has always been far more acute in the United States than has been the case here, and the Minneapolis device is but one of the many designs offered to the American public during the last few years.

Incidentally, the Minneapolis was also noteworthy in its day for the fact that its gear box was made integral with the crank case, and it must have been almost the first example of this type of engine construction.

L. FRANCIS JONES.

The Minneapolis spring frame.

A design for a Zenith Gradua machine. See letter from Mr. Norman Forster on this page.

## Double Helical Springs.

Sir,—Knowing the interest you take in the development of the rear spring systems for motor cycles, and the way in which you put each suggestion before your many readers, I am sending to you a description and sketch of a system that I have invented, and for which I hold a provisional patent, trusting that you will find space for it in your most

**Spring Frame Design.**

interesting and valuable journal. The following is the description:

The axle of the rear wheel is fixed in a special framework consisting of a tube running from the gear box round the back of the wheel and returning to the gear box on the other side. This arm is intended to pivot on the shaft of the driving pulley, ball bearings being, of course, used in the moving parts. This arrangement allows the wheel a radial motion around the centre of the driving pulley so that the tension of a belt or chain driving the rear wheel from the pulley is constant. It is necessary that the gear box be *above* the lower members of the frame, as will be seen from the sketch. This,

The Bickell design.

I find, could on most popular makes of cycles be altered with very little trouble.

Two special lugs are fitted where the four rear members of the ordinary frame meet—one on each side. In the back of each lug is a slot through which passes a continuation of the axle. Thus the wheel is able to move up and down in the frame according to the length of the slots. To prevent side thrust and undue strain on the countershaft two rods—one on each side—are attached to the continuation of the axle. These rods are of the same curvature as the arc described by the rear axle as it moves up and down in the frame, and they pass through the tops and bottoms of the special lugs. Then the rear axle is free to move up and down in the lugs, but all other motion is prevented by these rods. Now the springs are placed in position. Two strong coil springs are fixed between the axle and the top of the lugs—one on each side—so that the rods pass through their centres. These springs support the weight of the cycle and absorb road shocks. Below the axle are two shorter springs placed similarly to those above, but not having such great strength. These lower springs absorb the rebound of the main springs in the event of the cycle striking an object when at speed. The lugs, when fitted, would have a casing to cover and protect the springs.

The axle would, of course, need to be of the "knock out" type, of which the A.J.S. is a splendid example. The removal of the wheel would, therefore, be in no way altered on account of the special frame. The frame itself would be little altered; and, a point in favour of my system, whereas the movement upwards of the axle of a bicycle fitted with a laminated or leaf spring system is comparatively small (obviously, it cannot be great, or the tension of the belt or chain would be altered appreciably), with the coil spring system I wish to bring before your notice an upward or shock-absorbing motion of 5in. or even 6in. could be obtained, and this without interfering with the transmission in any way. The mudguards could be attached either to the wheel framework or to the main frame itself.

I have taken a very great interest in the many designs published in your paper week by week, and I trust that you will consider this worthy of a place in your pages, and also worthy of the criticism of your many readers.

STANLEY F. BICKELL.

**A Good Design.**

Sir,—I was very much interested in "Amateur Designer's" article on spring frames in your issue of February 3rd.

He put down all the chief weaknesses very clearly; but I do not altogether like his suggested amendment, as it would necessitate heavy lugs in

which to hold the laminated springs, and also, I should think, he would have difficulty in placing his gear box where the distance between its driving pulley centre and the centre of the back wheel would be constant.

I enclose a plan of my own, in which I use two semi-elliptic springs below and two quarter-elliptic springs above the back wheel. The two top springs are merely to steady the wheel and to adjust the machine for any weight, as suggested.

The radius rods from the back axle to the gear box centre could be put on lugs brazed to the frame instead of as shown if more convenient. You will also notice that the frame is "theoretically correct," i.e., straight top tubes, and the front down tube, saddle tube, and bottom back stays meeting in a point.

The frame has a double top tube, each tube starting from the head and then being brazed into the saddle pillar lug, whence two more tubes, only slightly out of the line of the first two, form the back stays, which terminate behind the back wheel.

Otherwise, I think the plan is self-explanatory, except for the engine, which has an outside flywheel, and cylinders fixed down after the manner of the excellent A.J.S. machines.

H. S. W. ADDENBROOKE.

**A Suggestion from Nyasaland.**

Sir,—I have been extremely interested in your advocacy of the spring frame for motor cycles. The activity displayed in this direction by designers is remarkable, and the number of designs at the disposal of motor cyclists will soon be legion.

Motor cycle manufacturers must be at their wits' end to select the most suitable design to meet their requirements, and even when their selection has been made it is not unreasonable to suppose that the design may become obsolete before it is offered for sale to the public.

I think, as a matter of economy, it might be wise for the manufacturers of motor cycles to leave the matter of spring frames to cycle frame manufacturers. By doing so they will enable the public to choose the type of spring frame most suitable to the requirements of the rider, as I am certain one type of such frame will not suit all riders. To have a selection of frames will add to the popularity of most makes of motor engines, and especially those that are popular already.

Again, in all probability, it may be found that one type of frame is most suitable for summer riding while another type is better adapted for winter riding, and the enthusiastic rider will thus be enabled to make his mount an all-weather machine. It would also enable Colonial motor cyclists to select the frame most suitable for their requirements. It might also tend to standardise the frame-fixing parts of engines, and also, let us hope, to standardise the threads of bolts and nuts.

There is most certainly no necessity for having more than one type of frame fixture for round crank cases, and another for, say, square-headed crank cases. This would enable the frame manufacturers to cater for the trade with some hope of large outputs of their wares. It would also enable the purchaser to exchange engines or frames, as well as to purchase some new type of frame that may take his fancy. The combinations of engines and frames would be extremely interesting, and add an attraction to the buying public.

J. M. INGLIS.

Nyasaland.

Commendable design of rear springing evolved by H. S. W. Addenbrooke

## Wounded Soldiers in Sidecars.

An Enjoyable Outing into Surrey arranged by the Harley-Davidson Motor Co.

The gallant men lined up after the lunch and entertainment at Burford Bridge.

ON Saturday last the Harley-Davidson Motor Company organised a most successful day's amusement for wounded soldiers in sidecar combinations belonging to the firm and private customers. The event was extremely well carried out, and, to use a familiar expression, went with a swing from start to finish.

Twenty wounded came from St. Thomas's, fifteen from the City of London Red Cross Hospital (which is a sort of branch of St. Thomas's), and ten from St. George's Hospital. There were about thirty sidecar combinations in all, and three or four cars; of these, one belonged to Mr. Duncan Watson, while another was driven by Mr. G. Petyt. The first batch got away punctually to time, and were soon bowling along over Westminster Bridge and then westwards on the Chelsea Embankment. Our passenger was a good-looking boy—he looked no more than a youngster—who had had six years' soldiering and had been transferred from India to France, where he had been wounded at the battle of Loos. This was his first excursion from London, and his first ride in a sidecar, and he much enjoyed it.

### Protection from the Rain.

The morning was fine at first, but it became very cloudy at noon, and shortly after starting there was a brisk shower which lasted half an hour. Fortunately one of the instructions on the programme urged drivers to bring waterproofs or coats for their passengers, and at the first sign of a downpour we helped our man into an oilskin. A little further on we met a large batch of about twenty who were busy donning coats. All along the Embankment the long line of sidecars wended its way, and a very interesting

procession it made, motor cyclists in their weird and wonderful garments and the passengers some in ordinary military caps, some in Glengarrys, here and there an Anzac head-dress, and in one instance a sailor's cap.

The police were much impressed, and smilingly held up the traffic as the serpentine of sidecars wound its way past them. At Putney it was raining fast, but as we all sped up Putney Hill in a bunch and reached the Common the worst was over. The ascent of the hill which rises out of Kingston Vale from the Robin Hood was worth watching. We were all in a bunch (which did not matter, as there was no dust), and all seemed to be climbing at the same speed; it was quite the best

"one-design" event we have ever witnessed.

### Getting away from the Tramlines.

We left the tramlines at the top of Kingston Hill, thereby following the programme instructions to the letter. "Don't forget to avoid tramlines," said that worthy publication, and then gave a route which followed them, so we took a not too well-known short cut, promptly lost the others, and saw them not again till we reached the rise out of Chessington, and in two minutes the vanguard arrived. Here the photographers awaited us, grumbling that they had had all their work cut out to get their pictures. They then took two or three hurried snaps, and set forth

A halt on the road for the benefit of the photographer.

**Wounded Soldiers in Sidecars.—**

to execute a clever strategic movement. It was cold indeed in that open piece of country, but nobody cared. Nothing happened till we got to a point half-way between Leatherhead and Burford Bridge, where the photographers brought up their artillery across the road and prevented the column from debouching by their curtain of fire. Thereafter there was nothing to report, except that we all reached the Burford Bridge Hotel after a splendid run some few minutes ahead of schedule.

Everybody was ready for lunch long before the appointed hour, but punctuality was the order of the day, and to the minute the chairman took his seat at the top table in a separate entertainment room in the hotel grounds. It was a good lunch smartly served, and the men fell to with a will. Altogether there were 104 seated at the tables. After lunch came the concert, and a very good one it was. The programme was admirably selected, and each item was appreciated to the full. There was nothing mawkish or sentimental, several good songs, which, when finished, made one want more, a banjo piece at 4,000 r.p.m. into which both performer and

accompanist put an amazing amount of energy, and brought down the house, and two or three most amusing turns. A message was received from the chairman of the A.C.U. wishing much success to the event.

**The Speeches.**

Then followed the speeches, which were short and to the point. Mr. Duncan Watson, in a brief and soul-stirring little speech, told of the way in which the gallant soldiers' work for their country was appreciated. All could not go and fight, but if those who stayed behind could give these splendid fellows one hour's happiness and enjoyment, they felt that in those moments they were indeed serving their King and country. He went on to mention the name of Mr. G. Q. Roberts, secretary of St. Thomas Hospital, who, through being himself a motor cyclist, had talked over the military commandant, had overcome his prejudice, and made the outing possible.

Mr. E. M. P. Boileau, *The Motor Cycle*, in replying on behalf of the guests and the press, mentioned the difficulties he had had last year in organising a similar event, when the originator of the idea, a patriotically-disposed lady, had approached a dozen military hospitals, the authorities of every one of which had refused to allow the patients to go out in sidecars, and how eventually it was found only possible to take out wounded Belgians. Mr. Roberts had done good work in overcoming that prejudice, and the Harley-David-

son Motor Co. had set a splendid example to other motor cycle manufacturers in inaugurating such a good work.

Then arose a gallant Anzac, Sgt. Robb, a soldier bluff, who knew how to address his men and spoke full of gratitude on behalf of the wounded. He had been initiated on the way down into the joys of motor cycling, and wanted to take a sidecar machine back to Australia with him; he had got as far as asking the price. (Cheers.) When he was in Gallipoli he wondered, while things were at their worst, if life was worth living, and why there was such an awful thing as war, but when he came to London and enjoyed the wonderful hospitality there shown to him he knew it was indeed worth while, and for that would go through it all again. On behalf of his fellow men he expressed his great gratitude, and as a small token of appreciation he handed a splendid bouquet of flowers to Mrs. Duncan Watson.

Mr. G. Q. Roberts, who arrived after lunch and was accompanied by his son, Sec.-Lt. A. Q. Roberts, R.E., formerly a keen competition rider, then made a brief and amusing speech, in which he thanked the Harley-Davidson Motor Co. on behalf of St. Thomas's Hospital, and mentioned how much he admired the excellent organisation of the event. What he had had to contend with was not prejudice but ignorance—a fault from which he suffered when he walked and other people used motor cycles.

The journey home was made in fine weather though cold, and all arrived in good time at their destination

**SCENES ON THE HARLEY-DAVIDSON OUTING FOR WOUNDED SOLDIERS.**

Thirty Harley-Davidson sidecar outfits and a few cars were used to great advantage on Saturday last in giving pleasure to forty-five wounded men. In the left-hand corner are Mr. Duncan Watson, the new chief of the Harley-Davidson Co. in London, and his wife.

## TIME TO LIGHT LAMPS

GREENWICH TIME

Feb. 24th	...	...	5.57 p.m.
" 26th	...	...	6.0 "
" 28th	...	...	6.3 "
Mar. 1st	...	...	6.7 "

### Dutch Trade and America.

The Cleveland two-stroke, the American lightweight best described as a cross between a two-stroke Triumph and a lightweight single-cylinder F.N., is the latest American motor bicycle to be represented on the Dutch market.

### Motor Wheel for Sleigh.

Motor bobs are very popular in the winter in the United States, and a few weeks ago we illustrated some typical outfits. These were all driven by big twin engines, but a keen rider of Saginaw, Mich., has fitted an Auto-wheel to his sleigh.

### When did the Four-cylinder First Two-stroke?

In view of the sustained interest in the two-cylinder two-stroke machine, it is worth going a step further and to enquire into the possibilities of the four-cylinder two-stroke engine. Such a machine was built several years ago by a well-known American designer, Norbert H. Schickel. In the course of experiments Mr. Schickel built a machine of this type, the cylinders being arranged V, but as the design was not followed up it may not have proved an unqualified

## SPECIAL FEATURES

ALL WORK AND NO PLAY. SIDECAR OUTING FOR WOUNDED SOLDIERS.  
AERO ENGINES AND MOTOR CYCLES.

success. Mr. Schickel has concentrated on the single-cylinder two-stroke, and his big 6 h.p. model has occupied a sound place on the American market.

### Queries.

Among the many enquiries which we receive daily are often strange requests, many of which go to prove that the work sometimes expected of the average motor bicycle is most curious. Within the last few days we received a letter, the writer of which had taken it for granted that a motor cycle was quite as much intended to work a water pump as anything else, while another reader wanted a sidecar machine suitable for carrying five up!

### Police Trapping in the Metropolitan Area.

We very much wonder if those motorists and motor cyclists who are special constables, and who in many cases have given their services, with their machines, to the Metropolitan police force, realise that they are being employed so far to relieve the police of their ordinary duties that they (the police) are now free to trap motorists indiscriminately. We should not be at all surprised to hear of several resignations among special constables for this reason, and we think that such a procedure would be fully justified. It may not be generally realised that there has been a large accession of young police recruits to the force, many of them men of military age, who would undoubtedly be doing better work in fighting for their country than skulking behind hedgerows in plain clothes, doing work as unpleasant as it is un-English.

Gunner J. H. Pearson, a motor cyclist scout attached to the No. 3 Battery, M.M.G.S., who has been killed at the Front after many months' active service. It is reported that Pearson, whilst riding his machine, met his death from a bursting shell.

### Police Timing by Flashlight.

Referring to the timing of motorists by police with flashlamps at Bromley, a correspondent writes: "I recently saw the same thing happening about nine o'clock on the north side of Clapham Common. As soon as a motorist went by, the constable would run to the middle of the road, hold a lamp quite near the ground, and make a flash."

### "Keep Out!"

The above notice is fixed on the door of the experimental department of the Indian factory at Springfield, Mass. From which one gathers that every step is taken to keep secret until perfection all efforts for improving the Indian motor cycle. Why not a soldier with fixed bayonet—that is, provided the U.S.A. army authorities have a man to spare.

### An Awkward Position.

Recently a motor cyclist who had taken his machine from Coventry to London by train was stopped when leaving Euston Station by a policeman, who asked him if he was the owner of the machine. After answering in the affirmative, he was next asked to prove it, and being unable at the moment to do so was requested to accompany the constable to the police station. Before doing so, however, the motor cyclist searched his pocket book and luckily found the registration form for his machine. Whereupon the constable apologised for having stopped him, and he was able to proceed on his way.

WOUNDED SOLDIERS' SIDECAR OUTING.

The start from St. Thomas's Hospital, Westminster. (See pages 182 and 183.)

**The National Relief Funds.**

At the week-end the principal war funds stood as follows:

The Prince of Wales's National Relief Fund	(£2,978,000 distributed)	..	..	..	..
Tobacco Fund	..	..	..	..	..
Fund for the Sick and Wounded	..	..	..	..	..
The Queen's Work for Women Fund	..	..	..	..	..
The Belgian Relief Fund	..	..	..	..	..

**Healthy Recreation.**

Did any sane man ever question that a little relaxation at week-ends is beneficial to a worker's output? Some busy-bodies would deprive munition workers and military motor cyclists of a week-end run on the open road, but they are not likely to succeed. The subject is referred to in a leading article and in our letters pages.

**The War Savings Committee's Appeal.**

As was to be expected, many of the daily-papers have taken advantage of the recommendation of the National Organising Committee for War Savings to inveigh against motoring and motor cycling. Of course the recommendation that money should not be spent upon useless extravagance is a good one, but why should motorists be singled out and accused of selfish and thoughtless extravagance? We contend that there is at the present time very little pleasure motoring of any description, and that far less is spent upon this kind of amusement than, for example, upon cinema shows. Was it not lately stated that the American films imported into this country (many of them not only weak, but injurious to the morals of the young) amounted to no less than £2,000,000 per annum? Can any such figures be quoted against pleasure motoring? We think not.

The *Daily Mirror* in particular has excelled itself, and has called a "motor trade expert" to its aid. This person makes the following extraordinary statement: "The average motor car is in charge of a chauffeur, who can do his

own minor repairs; the motor cycle is ridden by an amateur who, as a rule, can do nothing." We were about to say that if we substituted "office boy" for "motor trade expert" we could understand this, but on second thoughts we refrain—it would be an insult to the average office boy. The fact is that motor cyclists, as a rule, know much more of the interior of their machines than car owners. Then again, what about the chauffeurs? Ought not they to be serving their country? We fear our contemporary has spoken without reflecting, whereas . . . *Verbum satis sapientibus.*

**Retribution.**

An engineer was remanded at West London last week on the charge of stealing two motor cycles the property of Mr. Stuart Scott and Mr. J. E. Sharples. The fact that the latter's machine was missing was announced in our columns, and a few days later we received a note from Mr. Sharples, saying that, owing to the publicity given in *The Motor Cycle*, his machine had been restored to him.

**Nailsworth Ladder Climbed by 3½ h.p. Sidecar.**

A party of Bristol motor cyclists made a journey a few days ago to Nailsworth, near Stroud, to witness E. Kickham make an attempt on the notorious test hill, Nailsworth Ladder, with a 3½ h.p. Sunbeam and sidecar. At the first attempt the machine came to a standstill within a few yards of the top, owing to the driving wheel getting into a deep rut. On the second try, however, Kickham, we are told, made a perfectly clean ascent, and it is claimed that this is the first clean ascent of this hill to be made with a 3½ h.p. and sidecar with passenger. An 8h.p. Sunbeam and sidecar also made two attempts.

**Ford Yarns.**

A selection of Ford stories sent in by readers (including a number from the trenches) appear on pages 191 and 192. The prize has been awarded to J. B. Carroll, of Thorndene, Lytham.

**A Well-known Essex Rider Killed.**

Sec.-Lt. Mark Head, York and Lancs Regt., attached Royal Flying Corps, has been killed whilst flying over the enemy's lines in France. Mark Head was vice-captain of the Colchester and District M.C., and well known locally. He was one of the few private owners to take part in the Paris-Nice trial of 1912, when he rode a 3½ h.p. Zenith and received a silver medal. He saw twelve months' service as a despatch rider before receiving his commission.

**Exclusive Features.**

Following upon the first illustrated report of the hill-climbing expedition in Gloucestershire published in *The Motor Cycle*, and the hill-climbing feats in the Peak District, we give to-day the first illustrated description of the wounded soldiers' sidecar outing held on Saturday last.

Among designs new to motor cyclists, the 1917 model 4 h.p. chain-driven Douglas, the horizontal twin two-stroke Levis 422 c.c. engine, the Douglas of 1912, the Starley front fork, Parker's variable gear, and the 1916 Radco have been exclusively dealt with in our last three issues. *The Motor Cycle* is the only journal regularly dealing with week-end events.

**Monopolising Australasian Records.**

We have already published (page 135, February 10th) records put up in Victoria by Erwin G. Baker, riding a 1916 model Powerplus Indian. In addition to three hours, six hours, 200 miles, and 1,000 miles records, we learn by cable that the following were also established:

Twelve hours	..	576 miles
Eighteen hours	..	876 "

Chief interest centres round the 1,000 miles, the time for which was 21h. 3m. (=48 m.p.h.). Further information to hand states that the only stoppage other than for food and fuel (fifty minutes) was to change a valve. There was a high wind and rain throughout, and Victorian roads, over which the run was made, are nothing to boast about, though doubtless a comparatively good circular course was chosen. It is claimed that the Indian now holds every Australian record from half to 1,000 miles.

**Previous Records.**

Ivan B. Hart-Davies, who has made several remarkable runs on light cars and motor cycles on our famous End-to-end route, considers Baker's 1,000 miles a marvellous performance, and suggests that when the war is over Baker should come over here and see how long it would take him to go from John-o'-Groat's to Land's End. In the run made on a 3½ h.p. Triumph in 1911 Hart-Davies in the twenty-four hours out from John-o'-Groat's covered roughly 725 miles.

In May, 1909, H. A. Collier, riding a Matchless on the Canning Town track, covered 775 miles 1,340 yards in setting up the first twenty-four hour record.

**HONOURS FOR MEN OF THE MOTOR MACHINE GUN SECTION.**

Sgt. E. R. Mackey, awarded the D.C.M. for conspicuous service at Hooze, and Gunner J. Rafferty, who received the D.C.M. and 3rd Class Order of St. George for sticking to his post at Hill 60.

## The First Armoured COMMANDED BY SIB

are mounted on armoured cars, motor cyclist mounted infantry forming the support.

## "THE MOTOR CYCLE" RECRUITING SECTION.

### Vacancies in the Motor Machine Gun Service.

**T**HE Waiting List for the above Service—which was a fairly lengthy one—is now being drawn upon, and it may be that the list will not provide all the recruits required. A form of application appears below, and experienced motor cyclists are invited to fill in the particulars required, afterwards posting the form to Mr. Geoffrey Smith, Editor, *The Motor Cycle*, Coventry. The terms of enlistment in the M.M.G.S. are briefly as follow:

Pay, 1s. 2½d. per day, all found; the usual separation or dependents' allowance; enlistment for duration of war; overseas service.

Those readers who apply should not expect their acceptance by return of post, as usually a large number of applications are received.

### APPLICATION TO JOIN THE MOTOR MACHINE GUN SERVICE.

Name .....

Address .....

Chest measurement ..... Height .....

Group No. ....

or

Class No. ....

How long have you been a motor cyclist? .....

Can you execute running repairs? .....

Have you had any previous military training, and, if so,

when? .....

Are you medically fit? .....

Occupation .....

When free .....

After filling in the above particulars return to:

Inspecting Officer,  
19, Hertford Street,  
COVENTRY.

[Issue Feb. 24th, 1916.]

## MOTOR CYCLISTS PROMOTED.

We notice the following promotions in the official *Gazette*: Royal Engineers (Motor Cyclist Section)—Temp. Sec.-Lts. to be Temp. Lts.: W. Pyemont, F. R. Walls, A. Q. Roberts, C. J. Cadman, A. H. G. Kerry, J. A. Scrutton, H. B. Blower, C. S. Burney, H. J. Payn, and C. G. Brocklebank.

A.S.C.—Temp. Sec.-Lts. to be Temp. Lts.: S. W. Carty and R. W. Lovegrove.

## THE BRITISH INDUSTRIES FAIR.

### An Exhibition of British Manufactured Goods.

**T**HIS exhibition, which opened on Monday last, is of some considerable size and is devoted to those goods formerly bought from enemy countries, but now made just as well in Great Britain. The fair is easy of access, being in the Victoria and Albert Museum and quite close to South Kensington Station. The wares shown are for the most part such articles as toys, photograph frames, fancy goods, pottery, and glass.

Few firms of the engineering and allied trades are represented, and the only exhibits which will interest the motor cyclist are those of three or four electrical firms, and even on the stands of these we failed to find a single British-made magneto. The Effandem Co., Ltd., of Wolverhampton (stand A3), show an inspection lamp which can be attached to a button on the coat or tunic, the battery of which is carried in a sling case, and a cycle lamp which might be used on a lightweight for town riding. The stand (A 16) of Messrs. Ward and Goldstone, Manchester, was hardly ready. The goods displayed there consisted of the firm's patent dry batteries, accumulators, armoured cable, high-tension wire, and other electrical adjuncts. The British Ever-Ready Co. showed an inspection lamp and numerous lamps of the portable variety. No serious effort appears to have been made by the motor cycle trade to exhibit goods formerly purchased from enemy countries, such as watches, clocks, handle-bar mirrors, to say nothing of cheap horns and lamps or even magnetos. The Fair will remain open till March 3rd.

## MOTOR CYCLING IN FRANCE.

**W**ITH the present outcry against "pleasure" motoring in this country, it is interesting to compare the present state of things in France. Upon the outbreak of war cars and motor cycles were commandeered on a much larger scale than in England, and with conscription in force it followed that the number of motor vehicles on the road was considerably reduced. At the beginning, too, motorists were held up by soldiers at practically every bridge and level crossing for the examination of passports. The passport system has since been modified, and the French military authorities have established a special *laissez passer*, which allows one to circulate more comfortably in the "interior zone."

There is still a good deal of car traffic in Paris, but motor cycles have decreased, and a sidecar outfit is a rarity. In this connection, however, it should be remembered that sidecars are not so popular in France as in England. A further call has recently been made on the Paris taxicabs, and, repainted grey, they are used for the transport of officers.

As regards petrol, there was a scarcity for private users at the beginning of the war, but the situation was soon relieved, and until quite recently it has been easily obtainable, the price in Paris being 2s. 10d. per gallon. On February 10th, however difficulties were encountered in delivery, and a 25% price increase was made. This rise evidently corresponds with that in this country.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cyclist," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

#### Support for "The Motor Cycle" Spring Frame Campaign.

Sir,—Your correspondent "Ex-L.-Cpl." has my profound sympathy. I daresay I shall have his when I tell him that road shock has brought my motor cycling pleasures to an abrupt end. My Triumph was fitted with Brooks best saddle on a N.A.G. pillar. On ordinary roads the riding was luxurious, but the pot-hole stretches broke through all springs, and the shock to the spine was more than my advancing years could stand. I have sold my machine and gone back to the Raleigh, trusting to the Triumph promise to make good to us all when the war is over. Rear spring-riding alone will solve the problem.

W.J.C.

Sir,—Referring to the letter "Ex-L.-Cpl." on page 168 of *The Motor Cycle* of February 17th, I would recommend him to investigate the spring seat-pillars as supplied on 6 h.p. A.J.S. machines. I have one on my machine, and as a substitute for a spring frame I think it is as good as anything I have seen.

L. BLACKBURN.

#### The Isle of Man.

Sir,—I notice in your issue of the 3rd inst. a letter from the Rev. E. H. Stenning in reply to a reference to the Isle of Man S.P. Co.

Those who made a certain sea voyage on December 24th will probably never forget the Isle of Man Steam Packet Co., for it was blowing a gale with a very bad sea running. I have crossed to the Island on this ocean greyhound in fine weather, but little did I ever think that I should be on her with such a sea running and in the depths of winter.

The boat in question is not the only craft of the company that is doing similar work; there are others! Some of my friends have had "some" crossings.

I wonder if the Rev. E. H. Stenning has any idea what has happened to the ocean sleuthhound *s.s. Fenella*?

Re the latter part of the letter, surely all good motor cyclists have long ago joined the Colours? But let us wait until we have given the Huns their final strafing, and then for the Island and the T.T.

ALUMINIUM.

#### Two-stroke Design.

Sir,—I should like to reply briefly to Mr. Hughes regarding the points he raises in last week's issue of your paper.

His contention that the piston has to do extra work owing to the greater negative pressure on it during its cycle is hardly correct, for there is less negative pressure on it during its upstroke, i.e., when it is drawing in new gas, so that one balances the other. In fact, I should say the negative pressure on the upstroke is the more serious, for to overcome it power must be taken from the momentum of the flywheel, and at a time when it can ill be spared. His second contention about the increased amount of petrol lodging in the crank case is entirely wrong, as a little forethought would have shown him. Again, a high compression, or volume to be compressed, does not necessarily give a high efficient mean pressure, so his remarks under this heading are also wide of the mark.

I agree with him regarding the limits of the usual type of compression release valves, and I presume he includes his own firm's design in his rather sweeping assertion, for to me it seems a rather dangerous practice to pass back hot exhaust gases into the transfer port, while the advantages are of very doubtful value, and, to my mind, not worth the risk.

JAMES MARTIN.

#### Two and Four-stroke Lightweights.

Sir,—With reference to your footnote to my letter to you which you have reproduced in the last issue of your paper, I had in my mind when I wrote the matter of lightweights; I do not call a 180 lb. machine a lightweight. A machine of 100 lb. or under is the only type that can be termed a light motor cycle with a cubic capacity of 250 c.c. and under, which I note is what you refer to in your leading article, and which is what we take exception to.

The  $3\frac{1}{2}$  h.p. 500 c.c. M.A.G.-engined Motosacoche does not weigh 180 lb., and I cannot imagine anyone calling that a lightweight; also I cannot understand why a machine manufactured as a lightweight should reach this weight.

THE M.A.G. ENGINE CO., LTD.,

OSBORNE DE LISSA, Director.

[We should be glad to learn the names of any variably-g geared four-stroke lightweights suitable for Government requirements with engines of 250 c.c. and scaling 100 lb. It is instructive to note that the lightest machine in the Junior T.T. of 1914 was the  $2\frac{1}{4}$  h.p. 269 c.c. two-stroke Ivy, which scaled 159 lb., whilst in the A.C.U. Six Days' Trials of 1914 the lightest machine was the  $1\frac{1}{2}$  h.p. 162 c.c. Dayton, weighing 143 lb.—Ed.]

#### Pleasure Motoring.

Sir,—I notice several newspapers give publicity to the above, in regard to the suspension of all pleasure (so-called) motoring. I do not follow the Committee in its arguments, but doubtless abler pens than mine can defend the cause of the comparatively few "pleasure" motor cyclists. Under the Military Service Act, a large proportion of motor cyclists will be serving their country, thus automatically depleting the ranks of the "pleasers." To penalise those who, through physical disability or Anno Domini, remain civilians, and who are probably working under considerable stress, seems to me oppressive. Every gallon of spirit used contributes appreciably to the National Revenue, and to many a man the motor cycle or combination is his only means of relaxation. How many a wounded soldier has received benefit from motorist or motor cyclist who has placed his vehicle at his service for outings and drives? Does the War Savings Committee really think that by depriving the sorely pressed and worried garage proprietor of his living and connection, that it has taken perhaps years to build up, it will render financial service to the country?

It is difficult perhaps to write dispassionately, as an interested party, but surely other and more obvious economies are nearer to hand.

W. H. GOODENOUGH.

Sir,—I think, to put the matter plainly, the people who are endeavouring to stop motor cycling for pleasure, so as to economise, are very much on the wrong track. Generally to ban this form of recreation without making sure what the effect will be is, to my mind, very doubtful "economy."

If you will permit me to voice my own case I shall be drawing a parallel with thousands of precisely similar ones. I am an engineer working in a Government establishment on work which requires the best skill and attention. For the past eighteen months I have been working from 6 a.m. to 9 p.m. six days a week, and, in addition, two Sundays out of three. The few hours that I get I utilise to take my wife and daughter for a spin in the country, as I happen to be the possessor of a  $3\frac{1}{2}$  h.p. combination.

Those few hours of relaxation from the ordinary groove, change of scenery and air, have enabled me to boast that I am the only one out of a dozen on my job who has not been absent from work an hour through sickness. Panic remedies, for economising will neither bring the much-needed revenue nor win the war, besides inflicting unnecessary pin pricks on men and women who are doing their bit. W. JONES.

Sir,—My attention has been drawn to the recent appeal by the National Organising Committee for War Savings, which infers that there is still a great deal of pleasure motoring and resultant wastage of labour, etc.

This appeal is calculated to create an entirely erroneous impression, and is apparently based on an incomplete knowledge of the actual facts. The records of the Automobile Association and Motor Union, which has a membership of over 90,000, show clearly that the number of persons who are now keeping their cars for purely pleasure purposes is infinitesimal, and that, on the contrary, motorists as a class are rendering invaluable services to their country in the present crisis.

For instance, practically every wounded soldier returned from the Front has been transported from the railway stations to the hospitals by privately-owned motor cars without expense to the military authorities. In another direction, viz., recruiting, the Association made arrangements by which in every district in the United Kingdom the Officer in Charge had motor cars placed at his disposal. This represented a free gift to the country of more than a million miles. Many other instances could be quoted, but the two mentioned will give some idea of the extent to which the efforts of private motorists have been and are still being devoted to national purposes. It is hardly necessary to enlarge on the enormous saving to the country effected by this voluntary assistance.

With the need for economy in the use of motor vehicles for private purposes it is impossible not to agree, but, on behalf of the members of this Association, I feel that the misleading character of this appeal cannot be too strongly deprecated.

STENSON COOKE (Capt.),  
Secretary, Automobile Association and Motor Union.

#### Sparkign Plug Design.

Sir,—Adverting to the letter in your issue of the 17th inst., *re* the above, appearing over the name of the Sphinx Manufacturing Co., we note that the illustration B, taken from our patent specification, is, of the several arrangements illustrated in the said specification, the least like Lt. Burton's proposed sparkign plug, and, in fairness to us, we will therefore ask you to publish the corresponding part of figs. 1 and 2 of our specification.

The Forward patent sparkign plug.

We think that the Sphinx Manufacturing Co. may find in these illustrations the prototype which they fail to find in the particular arrangement which, for some unforeseen reason, they have thought well to select from our specification for the purpose of their remarks.

THE FORWARD MOTOR CO.

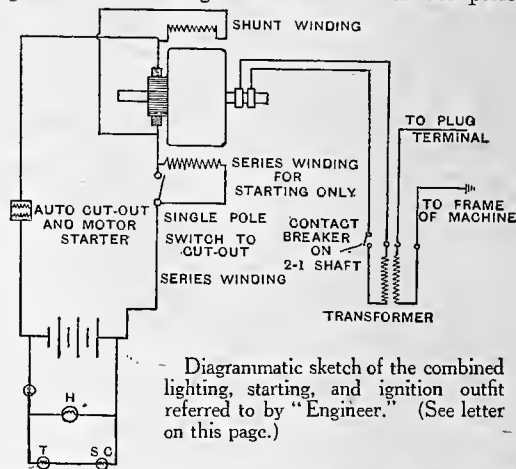

#### A Suggested Electric Outfit.

Sir,—There have been many references in *The Motor Cycle* lately to electric lighting and ignition outfits.

I think, personally, the final scheme will be something like the one shown in the enclosed sketch. The generator—I hate the word dynamo—will develop into a little rotary converter delivering low voltage alternating current at two slip rings at one end of the armature, and direct current at the commutator at the other end.

The field of the generator should be compound wound, a single-pole switch being provided for shunting the series

winding. Such a machine would be capable of starting the engine, as well as supplying ample juice for lighting and ignition purposes. The batteries should be of the Edison nickel-iron type, which are best suited for the heavy demands of a motor cycle. The operation of starting up would consist of opening the switch, thus putting the series winding in circuit, then closing the auto cut-out, provision being made for holding the cut-out in for the period re-

quired for starting up. As soon as the generator commences "revving," alternating current will be delivered at the slip rings, which will pass through the transformer (no contact breaker is, of course, required, as the current is alternating), which will step it up to the requisite voltage to jump the gap of the plug. When the engine gets up speed the series winding of the generator should be short circuited and the cut-out left to its usual functions. If the generator is gear or chain-driven, provision might be made for the contact breaker to break when the pressure wave is at its maximum value.

In this type of machine there is no necessity for a fine wire to be used for the armature winding. The only winding with a large number of amp. turns would be the secondary winding of the transformer. The transformer could, of course, be adequately protected from the elements by putting it in a vulcanite case.

ENGINEER.

#### Four-cylinder Motor Cycles.

Sir,—Mr. Hallam must indeed be a very prejudiced motor cyclist if in his opinion a four-cylinder motor cycle is the only one worth riding. Has he ever ridden a good  $3\frac{1}{2}$  h.p. single? It seems doubtful from the general trend of his letter. I have ridden several four-cylinder F.N.'s, and can quite realise their many good points, but it must always be remembered that a good  $3\frac{1}{2}$  h.p. single has, roughly, only a quarter of the amount of wearing parts in the engine that a four-cylinder has.

Four-cylinder petrol engines are all very well for cars, but the average motor cyclist has neither the time nor the patience to bother with a multitude of working parts (all of which are quite likely to give trouble), when a very much smaller number will quite satisfy his needs.

Mr. Hallam should use his eyes a little more than his pen, and he would then perhaps see that at least one of the best English motor cycle firms fits the front fork springs in "grease-packed cylinders." I am speaking of Messrs. Rudge-Whitworth, Ltd. I have a 1912 T.T.  $3\frac{1}{2}$  h.p. single Rudge with free engine, and ride this machine on an average of sixty miles a week, and can safely say that it is always ready to be ridden, does not require decarbonising more than once in 3,000 miles, and does not require a new inlet valve spring every 1,000 miles; it is practically a no-trouble mount.

BASIL BATE.

### "THE MOTOR CYCLE" SUBSCRIPTION RATES.

The rates for direct subscription to "The Motor Cycle" have been reduced, and are now as under:

Great Britain 6/6 All places abroad 10/10 per annum.

Subscriptions should be addressed to: The Publishers "The Motor Cycle," 20, Tudor Street, London, E.C.

P.O. Orders and cheques to be made payable to "The Motor Cycle."

## 4D FANCIES.

It is now quite a regular thing where motorists congregate to pass jokes respecting the Ford car, or "Flying bedstead," as it is affectionately termed, though some prefer the "galloping bedstead." In response to a recent paragraph a shoal of replies were received, and we submit the following selection with apologies to the Ford Co., Ford agents, Ford owners, people who have ridden in Fords, and people who have seen Fords.

**A** GARAGE proprietor, storing several Fords, having upset some insect powder on the floor of his garage rather late at night, decided to leave the sweeping-up process until next day, and upon entering the premises in the morning found four of the Fords on their backs! The Americans often refer to "road lice."

In 1917 Fords are to be fitted with a new pattern speedometer. At 10 m.p.h. a little blue electric lamp lights, at 20 m.p.h. a green one, at 30 m.p.h. a red one, and at 40 m.p.h. a small gramophone plays "Down Among the Dead Men."

**BIRMINGHAM PANTOMIME ARTIST:** "You don't need a speedometer with a Ford car!"

"Oh! Why?"  
"At ten miles an hour the bonnet rattles, at twenty miles an hour the screen rattles, and at thirty miles an hour your ribs rattle! It's a rattling good car!"

A Ford car was hurtling along the road one day, when by accident it ran over a little cock sparrow. The sparrow, of course, knew the make of car, having seen so many, and in his desire to have his own back his dying cry was "Cheap! Cheap!!"

**BREAKFAST TABLE PROBLEM.**—"Can I afford a Ford with an Off Ford body?" (We had better explain, for the benefit of the uninitiated, that Offord and Sons are well-known makers of special bodies for Fords.)

Policeman to chauffeur, who is vigorously turning the starting handle of a Ford: "Have you a licence to play? If not you must accompany me!"

Chauffeur: "With pleasure! Suppose we lead off with 'Rule Britannia'?"

"Say, how much do you want for your Ford car?"

"£70; and I'll throw a squirrel in with it."

"Why a squirrel?"

"Well, it will be useful to run behind and pick up the nuts."

"My car cost me £300."

"Why, I bought a rattling good one for £150."

"Yes—I have heard it!"

It is a case of "A short life and A-merry-can!"

It may not be generally known that Mr. Ford knows what a good car is, and owns a British-made Rolls-Royce. One day a friend asked him why he went in for a Rolls-Royce, and he replied that his factory was so busy producing Fords for other people that he could not get one for himself, so he bought the next best thing to it!

It is said that Henry Ford has made plans to shorten the wheelbase in 1918, the reason ascribed being that he can thus get more cars into this country.

A motorist was seen wandering about with a starting handle in his hand and striking match after match as he bent peering to the ground. Asked what he had lost, he said: "I was cranking up my Ford, gave the thing a good sharp pull and it flew out of my hand, and now I can't find it anywhere. Mind you don't tread on it."

A dealer in scrap metal sent a consignment to the Ford Co. by mistake. They acknowledged the parcel, and added that his car had evidently been in a bad smash. The repairs would be so extensive that they recommended the purchase of a new machine.

An owner of a Ford called at the works and asked to see the manager. On the arrival of that worthy the Ford owner greeted him with the following: "I believe that this works turned out a complete car in the space of twenty minutes." The works manager beamingly answered in the affirmative. "Well," replied the Ford owner seriously, "I'm convinced I got that one."

A man, after numerous unsuccessful attempts to obtain the return of his Ford car which had been stolen, put an advertisement in the evening paper to this effect:

"If the person who stole my Ford car last week does not return it to me by eleven o'clock to-morrow morning he will have to keep it."

Next morning, on looking out of his window into the street below, he found it packed with Ford cars as far as the eye could see.

Mr. Henry Ford's statement about the War Loan, as is well known, has made him very popular among the Allies! It will be recalled that when the loan was floated in the States he urged Americans to have nothing to do with it, and said that he would tie a tin can on to the loan commission's tail and scuttle it home again. Why a tin can? Why not a Ford car?

A Ford—a tinsmith's dream!

An agent was trying to sell an owner of a Ford car a speedometer, but his reply was, "Quite unnecessary, I have a cuckoo clock, the cuckoo of which sings, 'This is the life for me' when at speeds above 20 m.p.h."

Henry Ford has been lately dubbed the "Pieces Maker."

A Detroit marine merchant one day happened to strike a bit of luck and got a load of old iron bedsteads. The day being rather warm he stopped for some refreshment outside the Ford works. Suddenly a bustling manager came out of the works, and seeing the consignment, rushed in again, reappearing with a foreman. They approached the "thirsty one's" cart, and the manager was heard to remark, "I wonder who the deuce let this man have these chassis?"

A Ford will go anywhere—except in Society.

A wealthy gentleman went touring in the States with his big limousine. Owing to the very bad condition of the roads he affixed an electro magnet under the car to pick up nuts, etc., that might get shaken off his car. At the end of the first day the "bag" included a Ford car.

A gentleman driving a 50 h.p. limousine had the misfortune to have a bad skid, which landed him into a very deep ditch, with the result that with all his skill and horse-power he could not get back on to the road. Presently along came a Ford car, and the owner, seeing the trouble, attached a chain and pulled the unfortunate car back on to the road. After thanking the Ford owner, the gentleman turned to his chauffeur and said, "James, buy one of those things to keep in the toolbox."

## 4d Fancies.—

A gentleman drove up on a Chinese Rolls-Royce one day, and happened to stop near a school playground. It was cold, and on dismounting he proceeded to spread a rug over the radiator to keep it warm. An intelligent little boy, seeing this, ran up to the owner, and exclaimed, "It's no good hiding it, guv'nor, we saw what it was."

History lesson: Mr. Henry Ford, the man who popularised — walking!

Mr. Chas. Y. Knight, inventor of the Knight sleeve valve engine, tells a good story of Fords. An owner of one of these "Chinese Daimlers" living in the States advertised his car for 150 dollars, and got no replies. Accordingly he reduced the price to 70 dollars, but still no result. After another unsuccessful try at 40 dollars, he inserted an advert. to this effect:

"The Ford car I advertised for sale will be put outside my house at seven o'clock to-morrow evening, and anyone desiring it may take it away without charge."

At the appointed hour, the family, curious to see the kind of man who had seized upon the offer, drew aside the curtains to peep out of the window, and what do you think they saw? *Five more Fords drawn up behind.* The owners had taken advantage of the advertisement!

An American knut met two revue girls, and offered to take them for a joy ride in his car. They arranged to meet, and duly turned up at the appointed time. Eventually the knut arrived in a Ford. "Kid," said one of the girls, "it's a Woodbine."

A lady, wishing to purchase a car, entered a garage, but found she had forgotten the make of the car she had decided upon. All she could remember was that it started with "T." The garage proprietor ran through a list of well-known makes, and then he remarked: "You say it starts with T(ea). Oh! you must mean a Ford: all other makes start with petrol."

A sportsman drove up to the garage at Ascot in a Ford car. "Ten shillings," announced the attendant. "Right," said the sportsman, "it's yours," duly handing over his Ford.

A motorist drove up to a garage for petrol. A youth departed to interview his "boss," and returned with the message, "The guv'nor says he can let you have a gallon, if that's any use." On being asked to produce it quickly, the youth, taking a gallon measure, inserted it under the petrol tank of a Ford which was standing outside the garage, bearing the inscription "For Sale." Unscrewing a small drain screw, he watched an infinitesimal trickle of petrol find its way into the measure. After about five minutes' waiting, the motorist, despairing of ever reaching his destination,

exclaimed, "Oh, never mind draining the beastly stuff out—I'll buy the car!"

A man strolled into a garage one day looking for a job, and bragged that he could tell any make of car by the sound of the exhaust. Being amused at the claim, a garage employee thought he would give him a test, and so, after blindfolding the newcomer, started up a six-cylinder Napier. "Napier!" ejaculated the blindfolded one. Correct! Next a Vauxhall was started. "Oh, that's a Vauxhall," was the correct diagnosis. At that moment a mechanic at the other end of the garage let a box of spanners fall down a long flight of steps. "Ford!" exclaimed the clever one.

## THE BOWDEN VALVE GRINDER.

MOTOR cyclists who look after their own machines know how tedious a job it is to grind in the valves. This very necessary operation has been considerably facilitated by the introduction of the Bowden valve grinder, which we show in operation on an old pattern J.A.P. motor bicycle. By its means a valve can be ground accurately with a minimum amount of labour. It will be seen that

The Bowden valve grinder in use

the valve, after a light spring has been placed underneath its head, is inserted in position; the bottom portion of the tool surrounds the stem, while the top portion, which is the shape of a screw-driver, falls into the slot on the valve head. The instrument is gripped in the left hand, by means of which the requisite pressure can be obtained, and by the right hand the rack is moved backwards and forwards. This engages with a pinion, and thus an oscillating motion is imparted to the valve, and at intervals, owing to the spring, the former may be raised off its seating, thus preventing any possibility of rings being formed in the face of the valve.

This device is marketed by Bowden Wire, Ltd., Kimberley Road, Willesden, London, N.W.

## Average Prices OF Second-hand Machines.

WE give below the average prices of second-hand models offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model the average for the past week is quoted. If there were not at least two advertisements, then the last average is given.

# QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and the replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" on the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

## Carburettor Catching Fire.

**Q** (1.) I have been troubled by the carburettor of my machine catching fire when starting or stopping or running at slow speeds. (2.) The exhaust valve closes at the right time, viz., when the piston is on the top dead centre. Would there be any advantage in making it close earlier? (3.) The ignition, however, appears to be timed a little late. (4.) What would cause the engine to become carbonised on the piston top and cylinder in so short a distance as twenty miles?—A.E.C.

(1.) The cause of the carburettor catching fire is usually due to too weak a mixture, which causes popping in the carburettor, and if any spirit is about it will then ignite. It might also be due to a very weak inlet spring, or the valve failing to close properly. (2.) The exhaust valves closing when piston is on top is correct, and altering the timing would not improve matters. (3.) The ignition being timed late would not cause this trouble,

but would cause bad running and overheating. (4.) Carbon deposit is caused chiefly by over lubrication, too strong a mixture, or overheating. We should hardly think that much carbon could form in so short a distance as twenty miles.

## Fitting a Magneto.

**Q** I have a single-cylinder motor, which is fitted with accumulator and coil ignition, and gives fairly good results. I am thinking of fitting a magneto with direct drive from crankshaft, either by sprocket and chain or gearing. What gear ratio do I require for correct firing?—A.R.

You require to drive the magneto at half the speed of engine. You will probably find the simplest method to drive it will be by chain, fitting one sprocket to the pinion at present carrying the contact breaker cam, which is naturally geared 2-1, so no further reduction will be necessary.

## Alterations for Speed.

**Q** I have a 3 h.p. twin Enfield, and I should like to convert it into a racing machine. Could you kindly tell me the principal alterations I shall have to make?

I may mention that I have a workshop with lathe, etc., and could make new parts. (1.) As the engine keeps very cool, would a higher compression be advisable? I could raise compression by making deeper caps that screw on the top of the cylinders. If such caps were made of duralumin (aluminium alloy), would the difference in expansion crack the cylinders? (2.) The plugs are on the side of the cylinders in a recess. Would it be better if I fitted them in the cylinder head? (3.) What timing would I need for racing, and why is such timing not suitable for touring? (4.) My top gear is 5 to 1. Shall I make it any higher? (5.) I have taken 4½ oz. off the pistons and connecting rods. Will it make much difference?—C.D.

(1.) An engine when used for racing purposes only will frequently give greater speeds with a slightly higher compression than usually used for touring; but great care has to be exercised in not getting it too high, otherwise you may do a great deal of damage. You will probably find that with a higher compression the engine will be very prone to knocking at slow speeds, and will probably run considerably hotter unless great care in driving is used. We do not think it would be advisable to make the caps of aluminium alloy as the heat expansion is very much greater than that of cast iron. (2.) For high speed it is more usual to fit the plugs in the cylinder head, but they are very liable to become oily when in this position. (3.) Valve timing for racing machines varies very considerably; in fact, really each individual engine wants a special timing of its own to obtain the very best speeds. It is usual on racing engines to give a certain amount of overlap to the valves, and, as a rule, the lift is greater, and rise and fall quicker, than for touring purposes, the result being noisy tappets and more rapid wear and tear on all valve gear and timing. It is chiefly for these reasons that racing timing is not used on touring engines. (4.) For speed work you would probably obtain better results with a higher gear, say 4½ to 1. (5.) Unless you have rebalanced the flywheels after removing the weight from the pistons and connecting rods you will probably find that the running will not be so good, owing to bad balance.

Miss Dodds, the rider of a 6 h.p. Enfield two-speed passenger outfit, photographed at Mam Tor, Derbyshire.

**Driving Licence for the Deaf.**

**?** I shall be glad of your advice as to how I can obtain a driver's licence. The young man who lives with us and myself are both deaf mutes, and recently we went to our police office to apply for a licence, but the Chief Constable said it was too dangerous for us and that he could not take the risk of granting us a licence, but suggested we interviewed the Watch Committee a week later. We have got a second-hand  $3\frac{1}{2}$  h.p. Triumph motor cycle, 1909 model with 1913 engine, waiting for us at an agent's shop. I do not see any reason why we should not be granted a licence on account of our being deaf. It is not only the ears that one has to depend upon to avoid accidents. I have ridden a push bicycle for over twenty years without any accident at all through my deafness. Nowadays ladies and mere boys are driving motor cycles, and it is very unfair not to allow a capable deaf mute to enjoy the advantages of motoring, especially for me, as I want one for my business as well as for week-ends. Some years ago I cycled all the way to London from Rotherham in one day, alone, and after three days' stay there returned again without meeting with any mishap.—G.H.B.

The local police authorities cannot refuse to give you a licence on the grounds that you are deaf and dumb. Beyond the age limit, there are no strict regulations as to the issuing of driving licences, and if the police refuse when you apply again we would suggest that you ask them to show you the authority on which they refuse.

**Starting Difficulty.**

**?** I am the possessor of a twin-cylinder, belt-driven, 1912 5.6 h.p. Rex, which I find extremely hard to start up. It is fitted with a Bosch magneto, B. and B. carburetter, two-speed gear, and handle starting. When cold the engine is very stiff, and only when a good deal of petrol has been injected is it easy to move it. The compression is very good indeed. I use T.T. Mobiloil. The spark is very good, and I have fitted two new plugs. It takes me fully a quarter of an hour to get going, which I think rather a long time.—T.F.B.

Difficult starting is nearly always due to one of two causes, or perhaps a little of both—that is, poor carburation and a poor spark. The engine being so stiff to turn over when cold is due to the congealed oil between the cylinder and piston, and if the oil is very heavy the film between the crank case and flywheel often makes the engine stiff in cold weather. You should use a light oil in winter. To obtain easy starting there

must be no air leaks between the carburetter and engine, or *via* worn valve stems or carburetter slides. Bind up any doubtful joints with adhesive tape. What is wanted is a strong mixture, and not much of it. Try starting with air shut right off and throttle about one-third open only. The plug points should be clean, and not adjusted either too near or too far apart. About  $\frac{1}{16}$  in. is correct. If petrol does not free the engine sufficiently when starting, try a little paraffin. You should make sure the rocker arm on the contact breaker is quite free, and that the points are separating the correct distance—.4 mm.

**Piston Rings Carboned Up.**

**?** I have a  $2\frac{1}{2}$  h.p. two-stroke motor cycle. Some months ago the engine came back from the makers with a new crankshaft, piston, and bearings. I have since not been able to get anything like the same power out of it, and I have to use more than twice the amount of petrol. Just lately I took the cylinder head off and found the piston rings jammed. Moreover, they did not fit even when cleaned and the groove cleaned of all carbon. After fitting properly the result was wonderful; all the original power came back, but after about 100 miles I found the power fell off again. The bicycle would be running quite well perhaps, then gradually pull up with a grating noise. If I retarded the spark and gave very little air the bicycle would just take me along at about twelve to fifteen miles per hour, then, without any apparent cause, off it would go again, and after a mile or so repeat the process. On again examining the piston rings I found them gummed up, and also I found the two holes in the transfer port stopped up with carbon. These I cleaned out, and recently I could get no power, but used very much less petrol than I have been doing. Can you tell me (1) why the rings should have got dirty so quickly? (2) How I can clean out the transfer port thoroughly? (3) Would overheating be due to the spark being too far advanced? I advanced the ignition timing a few weeks ago, and seemed at the time to get better running and no knocking.—R.W.B.

(1.) The cause of the piston rings jamming is that the engine has been working rather hot. This may be due to (a) poor quality oil, (b) bad fitting piston rings, (c) too rich a mixture, (d) over gearing, or (e) overloading. (2.) The way to clean the transfer port is to remove the cylinder, scrape the port with a suitable tool, and wash it in paraffin. (3.) The spark being too far advanced would not cause these symptoms; it would simply cause knocking. The cause of the machine pulling up is probably pre-ignition, due to overheating or a faulty plug.

**Re-magnetising a Magneto.**

**?** We have a 20 h.p. petrol motor, which will not run on the magneto. We think that the magnets want remagnetising. The only means at my disposal is a 60 volt lighting circuit (from accumulators) with an average load of 30 amps., and I thought of winding each magnet (there are three) with as many turns as possible of 1.18 in. wire and connect in series with the lighting circuit. I would get about seventy turns on each. The lifting power of each magnet is now 4 lb. If you think the magnets need remagnetising, is my method any good; if not, which is the best way?—J.M.

If your magnets each have a lifting power of 4 lb. we should say that they do not require remagnetising, and that the trouble probably lies in the winding or insulation of the armature, or perhaps to a faulty carbon brush or holder. To remagnetise the magnets you require a powerful two-pole electro magnet, and need to wipe the ends of the poles of the magnets across this, being careful to apply similar poles to each other, otherwise instead of magnetising them you will demagnetise them. Although there is no reason why you should not be successful in remagnetising them in this way, it is a job which requires a certain amount of skill, and we should think it would be more satisfactory to send them to some firm specialising in this work.

**EXPERIENCES WANTED.**

"J.H." (Moffat).—Use of Oildag with lubricating oil.

"G.H.G." (Cambs.).— $2\frac{1}{2}$  h.p. De Luxe T.D.C. with and without sidecar. Reliability and efficiency.

"G.S." (Wensleydale).—Scott combination or Rover. General efficiency, consumption, and tyre wear.

"J.H." (Keighley).—Hobart-Villiers two-stroke, two-speed, with Binks three-jet carburetter. Consumption, easy starting, reliability, acceleration, and power.

"F.J.M." (Castleblayney).—1915 5 h.p. spring frame Bat, 1915 4 h.p. A.J.S., and 1915  $3\frac{1}{2}$  h.p. Sunbeam. Reliability, consumption, and general efficiency.

"J.S." (Leith).—B.S.A.  $4\frac{1}{2}$  h.p. Reliability, general efficiency, speed, and consumption, with and without sidecar. Also Morgan runabout. Reliability, consumption, speed, and general efficiency.

**RECOMMENDED ROUTE.**

TRURO TO NEWBURY.—F.M.

Truro, Ladock, Bodmin, Launceston, Okehampton, Exeter, Honiton, Chard, Wincanton, Amesbury, Andover, Newbury.

**PUBLISHERS' ANNOUNCEMENT.—THE RESTRICTED SUPPLY OF PAPER.**

In view of the decision of the Government to limit the import of material for the manufacture of paper it is imperative that every possible step should be taken to avoid waste of paper in any form. It has been the custom in the past for newsagents to order a certain number of papers for chance sales, and these copies if unsold become what are known as "returns"; in other words, waste copies.

In the case of "THE MOTOR CYCLE" the percentage of returned unsold copies has been remarkably low, but in order to conserve the supply of paper in future it is desirable that the waste of copies, ordered to accommodate occasional purchasers, shall as far as possible be eliminated.

Readers of "THE MOTOR CYCLE" are urgently requested to assist in this matter by always buying their copies from the same place, if possible, or by giving a definite order to a newsagent for the regular supply of the journal each week.

## Machine Gun Sidecars.

A DESIGN PERMITTING A WIDE RANGE OF FIRE.

THE gun-carrying sidecar outfit is one of the products of the present war, but already much ingenuity has been bestowed upon it, as must be well known to readers of our pages. We herewith describe the patent of Mr. T. H. Tessier, of the Bat Motor Mfg. Co.

The sidecar frame is very much wider than usual, and it carries a number of small rollers arranged in a circle. On these revolves a circular platform which is pivoted upon a central stud. On this stud and beneath the platform is fixed a large gear wheel. The platform carries a short vertical shaft fitted at the top with a hand wheel and at the bottom with a pinion which meshes with the gear wheel. By rotating the hand wheel the pinion revolves on the gear wheel, and the whole platform is rotated. The platform carries the gun tripod and the gunner's seat, which can be revolved through a very large angle. The gear wheel is engaged by a catch which can be withdrawn by depressing either one of a pair of pedals. The gunner can, consequently, after depressing one of the pedals, revolve the whole gun platform by merely rotating the hand wheel to the required extent. Then when the pedals are released the platform is locked. The gun is intended to be fired from the machine.

T. H. Tessier's patent machine gun sidecar outfit.

## Motor Cycling in the Panama Canal Zone.

IT would seem, writes a Californian correspondent, that the authorities in the Canal Zone do not look upon motor cycles with much favour, judging by the strict regulations imposed upon them. In the first place the registration fees are very high, being eleven

dollars to the Canal Zone and two dollars to the Government of Panama. The speed laws are very rigid, the limit on all roads being eight miles an hour, and the very lowest fine for "hogging" is £6, so the man who likes to "joy ride" might as well take a good brisk walk and let it go at that.

Nevertheless there are a few enthusiasts. Among them is W. M. Taul, a young man connected with the Electrical Division of the Panama Canal Commission at Balboa, who is the owner of an Indian, which he uses in connection with his work. He says that there are only fifty miles of rideable roads in the whole Isthmus, and in some places the roads are so narrow that, when a motor cycle and a car meet, one or the other has to drive into the jungle in order for the other to pass.

One of the principal rides, and a very interesting one, is between the Canal Zone and the Republic of Panama. Besides the old churches and ruins to be seen in the ancient city of Panama there are sports of all kinds, such as bull fights, which bring a large number of people from the Zone in automobiles and cycles.

Motoring in the Canal Zone is limited by strict speed limits, lack of good roads, etc., but these drawbacks do not prevent the riders shown from enjoying many spins.

# PATENTS.

Abridged by ERIC W. WALFORD.

## The Dunhill Sidcar Frame.

The main frame members AB are connected at the rear by the tube C, and at the front are coupled to the front attachment tube D. A member E extends completely round the wheel, so that this is supported on both sides. For the attachment of the rear of the body a frame F is employed, which is pivoted about the tube C. At the front this pivoted frame is connected to the main tubes AB by means of coil springs G, whilst a spring-mounted bearer bar H forms the front body support. The action of the pivoted frame F brings the body load directly over the axis of the wheel, so that a strong construction results.—Dunhills, Ltd., and W. H. Field, No. 4,784, 1915.

## An Auxiliary Cooling Device.

Screwing into or taking the place of a valve cap is a long hollow body A provided with cooling ribs B at right angles to its axis. The central passage C is open to the hot gases, which are quickly cooled by conduction of the

body. The effect of the retention of exhaust gases in the cavity C would, of course, vary with its capacity, and can only be determined by a practical test of the device. The writer's experience would lead him to expect pre-ignition when the engine was hot.—W. Rogers and F. M. Smith, No. 3,239, 1915.

## Easy Valve Removal.

With large engines having horizontal opposed cylinders, removal of the valves is not always an easy matter, owing to the interference of the back mudguard or frame in the case of the back cylinder, and the front mudguard or frame in the case of the front cylinder. To overcome this in the present case, the valve seating is made removable so that it and the valve can be moved in the direction of the camshaft when it is desired to remove the valve, and this,

of course, means that grinding in can be done away from the machine, and if necessary a complete ground-in valve

As will be seen from the sectional view the valve seating A with the gas passage B is detachable from the cylinder casting, and the two seatings of each cylinder are held in place by a single dog C. On removing the dog the parts A and B must first be moved to the right to allow them to come away. To facilitate this a special tool is used comprising a kind of hook D, one end

E of which catches under the valve washer, whilst the other end F hooks on to a peg at G, which is formed on the cylinder. To use the tool the engine is turned until the valve is lifted, and the tool put into place. Then the crankshaft is turned so that the tappet drops, leaving a big clearance between the foot of the valve stem and the tappet. The valve and seating can then be moved freely towards the camshaft and lifted away.—Humber, Ltd., and H. Trickett, No. 3,187, 1915.

## A Steering Head Construction.

The steering stem A is carried in bearings as usual, the upper one being adjustable by means of a nut B, which is clamped by means of a split plate C, through which passes a bolt D, the ends of which are secured to the upper ends of the two fork members E. The lower end of the steering stem is also connected with the fork members by the bolt F. The handle-bars G are carried by clamps H on the fork members, and by loosening these clamps the bars can be twisted to provide an adjustment of height. It will be noticed that the handle-bar is slotted at the centre, and that the control wires J pass along the handle-bar, through

this slot, and down the hollow steering stem A, so that they are out of sight for the greater part of the length.—G. E. Bradshaw, No. 90, 1915.

## LOST AND FOUND.

We receive many letters regarding accessories, etc., both "Lost" and "Found," which we are unable to find space for. As these particular matters are of interest to two persons only, viz., the finder and the loser, we keep a list of such articles, and all that are notified to us are inserted in this list. Should we receive a letter from the finder which corresponds to the article lost, the two persons are put into communication, but it must clearly be understood that we cannot enter into correspondence on the matter beyond this.

## MOTOR CYCLES FOR SALE.

## Alldays.

**ALION**, 2-stroke, 2½ h.p., late 1915, almost new, not done 200 miles; owner riding combination; £28, or offer.—Parkstone, Coombe Rd., New Malden, Surrey. [1510]  
**3½ h.p.** 1915 Alldays, 3-speed hub, been 2,300 miles, 32 lead and rear lamps, speedometer, horn, tools complete, excellent running order; £40.—A. B. Cowley, R.A. Mess, Wealdon. (D) [X2756]

## Ariel.

**1914 Ariel**, 3-speed, 2 lamps, tyres excellent, thoroughly overhauled; £31.—Stoner, Aylsham, Norfolk. [1573]

**ARIEL**, 3½ h.p., 3-speed, Sturmer-Archer, 1914, and sidecar, lamps, etc.; £32.—18, King St. East, Rochdale. [X2771]

**1913 Ariel**, 3-speed, 3½ h.p., and sidecar, in perfect order; £35; easy payment arranged.—Jones, Garage, Muswell Hill, N. [1207]

**ARIEL**, 3½ h.p., 1911-12, Gradua gear, free engine, splendid order throughout; £17/10.—Speechley's, 45, Church Rd., Acton. [X2980]

**1916 Ariels**, 5-h.p. and 3½ h.p. combinations actually in stock; ladies taught free by lady tutor; deferred payments arranged.—Ariel Special Agent, Jones, Garage, Muswell Hill, N. [1206]

**2½ h.p. Ariel**, 4-stroke, U.H. waterproof, B. and B. 22 variable spring forks, low and light, excellent condition, and cash for 2-strokes with gears; sell £14.—Hartley, Shorey Cottage, Burnley. [X2820]

**ARIEL**, 3½ h.p. 3-speed combination £32/10, 5-6 h.p. 3-speed combination £35/10, all changes in stock; special deferred payments; liberal exchanges.—Lamb's, 151, High St., Walthamstow, and 50, High Rd., Wood Green. [1369]

## Arno.

**ARNO**, smart combination, 1914, 3½ h.p., 3-speed, cane sidecar, well upholstered, lamp, horn, Sun-spray; 38 gns.—Railway Garage, Staines. [1519]

## Auto-Wheels.

**UTO-WHEEL**, 1916, latest model; £15/15, new.—Wilkins, Simpson, and Co., 11, Hammersmith Rd., London. [1319]

**UTO-WHEEL** and Singer bicycle; cost £24/10; perfect, did 150 miles; £17.—M. O'Brien, 82, Belle Vue Rd., Leeds. [X2892]

**UTO-WHEEL**, late 1914, not run 200 miles, perfect condition, complete with number plates; 7 gns.—Paterson, The Green, Walsend-on-Tyne. [X3069]

**UTO-WHEEL** De Luxe, latest model, £15/15, 26/3 monthly; a standard model, very little used, in splendid running order, £10.—Seen at 248, Bishopsgate, London. [1547]

## Bat.

**BAT** 6-h.p. Twin, in exceptional nice condition; £26.—Percy and Co., 337, Euston Rd., London. [1501]

**5-h.p. Bat-Jap**, 3 speeds, Swan sidecar, splendid condition, accessories; £58.—84, Mall, Swindon. [X3007]

**BAT**, 6-h.p., 1914, 3 speeds, countershaft, coachbuilt sporting sidecar, new condition; £57/10.—82, Case-wick Rd., West Norwood, S.E. [1453]

**BAT**, 1912, single-cyl., grey sporting model, recently overhauled, new bearings, piston, tyres, Rom and Bates; £21/10, or offer.—Owen, Hinton St. Mary, Dorset. (D) [X2988]

**BAT** 8-h.p. Twin, 1914, 3-speed countershaft, kick starter, T.T. model, speedometer, with or without sidecar; £38 and £42.—Percy and Co., 337, Euston Rd., London. [1502]

**BAT**, 1915, brand new, 4-5 h.p. twin, sporting model No. 1, 2-speed countershaft gear, French grey finished; list price £60/7/6; special price for cash £55.—Elce and Co., 15-16, Bishopsgate Av., Camomile St., E.C. [0491]

## Blackburne.

**1915 Blackburne**, 3½ h.p., 3-speed Sturmer hub, excellent condition; £48.—H.N., 278, High Rd., Streatham. [1570]

**BLACKBURNE**, late 1914, T.T., 3 speeds, hand clutch, special finish, sweetest running and prettiest machine on the road, Lucas lamp, spares, etc.; any demonstration; as new; £45.—Hobson, 7, Colthurst Av., Crouch End, N. Phone: 2339 Hornsey. [1296]

## Blumfield.

**BLUMFIELD** 5-h.p. Twin, T.T., 1915, good order.—15, King Edward's Av., Chelmsford. [1469]

## Bradbury.

**BRADBURY**, 4-h.p., free engine, semi-T.T., 1911-1912, complete; £23.—44, West Side, Wandsworth Common. [1405]

**BRADBURY**, N.S.U. 2 speeds, free, and almost new coachbuilt sidecar, mechanically sound, lamps, horn; 30 gns.—1, Henry St., Bury. [1283]

**BRADBURY**, 4-h.p., 1912½, 3 speeds, free engine, kick start, new Dunlops; £35; exchange Zenith. Matchless, Bat, cash adjustment.—35, Mowbray Rd., Brondesbury. [1477]

**4 h.p. Bradbury**, 1913½, and Singer C.B. sidecar, 2-speed countershaft, kick start, clutch, speedometer, and all accessories; £40, a bargain.—9, Market Parade, Stafford Rd., Wallington. [X2882]

## CORONET Sidecar Chassis

is designed for long life, and has a wonderful reserve of stability, and is safe on greasy roads. Luggage carrier built into frame. Cannot shake loose, and is a boon when touring.

£10 15s.

Send for illustrated catalogue describing these well known Sidecars.

EXCHANGES.

TRADE SUPPLIED.

We can give immediate delivery of all models, and suitable for any make of machine.

## Coronet Sidecars for Harley-Davidsons.

We make a special Sidecar, enamelled French grey to match, 28 x 31 tyre, apron to cover entire body, and 4-point attachment ..... £13 10 Immediate Delivery.

## 7-9 h.p. HARLEY-DAVIDSON.

11J, electrically equipped, 3 speeds ..... £76 13  
 11F, standard 3-speed model ..... £68 5  
 1916 models also in stock.

## NEW 1916 FORDS.

5-seater Touring Car ..... £135  
 Delivery Van ..... £130  
 Motor cycles taken in exchange.

## SPECIAL BARGAINS.

7-9 h.p. HARLEY-DAVIDSON, 3-sp., with coach Sidecar to match ..... £75 0  
 6 h.p. A.J.S., 1915, lamps, horn, speedometer, etc. .... £68 15  
 4½ h.p. STAR, brand new big single, 3-sp. countershaft gear, chain drive, kick starter; listed at £68 5s. .... £55 15  
 3½ h.p. LEA-FRANCIS, 1915, nearly new, 3-speed, kick starter, Hercules £13 13 Sidecar, £5 5 speedometer, £3 10 lamp set; the whole cost £94 10 ..... £85 0  
 2½ h.p. WOLF, 1916, 2-stroke, 2-speed ... £33 10  
 4 h.p. WOLF, 1916, 3-speed, chain drive. £49 11  
 2½ h.p. LEVIS, 1915, 2-stroke, 2-speed ... £25 15  
 1½ h.p. HUMBER, 1914, 3-speed model, with Sidecar ..... £39 15  
 3½ h.p. PRECISION, 1912, nice condition. £16 15  
 1913 HUMBERETTE Cycle Car, hood, screen, electric lamps, 3 speeds and reverse, good tyres ..... £55 0  
 3½ h.p. RUDGE, 1912, free-engine model. £19 15  
 2 h.p. 1915 O.K., 2-speed, nearly new. £23 15  
 3½ h.p. SINGER, 1912, 3-speed model, with cane Sidecar ..... £22 0  
 3½ h.p. SINGER, 1912, 3-speed gear ..... £22 10  
 3 h.p. HUMBER tricar ..... £5 5  
 4 h.p. WOLF, 1912, magneto ..... £9 10  
 4½ h.p. JAMES, 1914, 3-speed, with James coach Sidecar ..... £48 15  
 1909 P. & M., 2-speed, and Sidecar ..... £18 15  
 6½ h.p. DE DION light 2-seater car. .... £15 15  
 1915 MORGAN, 700 x 80 tyres all wheels, lamps, horn, hood, screen, speedometer, etc. .... £89 0  
 2 h.p. CALTHORPE Lightweight, 1914, 4-stroke model, countershaft 2-speed, nice order ..... £17 15  
 3½ h.p. PREMIER, 1911, B.S.A. 2-speed. £19 15  
 1915 TRUMBULL Light Car, hood, screen, detachable wheels, speedometer, electric horn and lamps ..... £89 15

## MISCELLANEOUS.

New Cane Body, open type; cost 35/- .. 10/6  
 New complete Sidecar Chassis ..... £3 5  
 New Cane Sidecar, enclosed body ..... £7 15  
 Wicker Sidecar Bodies; to clear ..... 3/6  
 New Coach-built Body, side door ..... 57/6  
 Brand New Waterproof Magneto ..... 70/-  
 New 21/- Clare Brass Electric Tail Lamp ..... 4/11  
 1916 Binks Carburettors. Your old carburettor taken in exchange.  
 New Torpedo Cane Sidecar ..... £7 10

**BOOTH'S MOTORIES,**  
 PORTLAND PLACE, SKIRCOAT ROAD,  
 HALIFAX.

## MOTOR CYCLES FOR SALE.

## Bradbury.

**BRADBURY** 1914 6-h.p. Combination, 3-speed countershaft gear, speedometer, lamps, splendid condition; £60, or take lightweight in part; seen after 8 p.m. or Sunday.—Tollfield, 22, Loampit Vale, Lewisham. [X2888]

**BRADBURY** 1914 6-h.p. 3-speed Combination, hood and screen, Lucas accessories, 63 gns.; also 1912 3½ h.p. 2-speed and coach sidecar, £35; liberal exchanges; generous deferred terms.—Lamb's, 151, High St., Walthamstow, and 50, High Rd., Wood Green. [1572]

## Brough.

**BROUGH**, 1916; orders booked now for early delivery.—W. P. Edwards, Taunton. [X9968]

**BROUGH** 3½ h.p. Twin, for immediate delivery.—Nelson, Gloddaeth St., Llandudno. [X2986]

## Brown.

**BROWN**, 3½ h.p., mag., a sturdy little mount; offered at lowest possible bargain price of £10/10.—Laytons' Garage, Bicester, Oxon. [X3062]

**3½ h.p.** 1909 Brown, Simms, B. and B., dropped frame, 32 spring forks, fine condition, worth £16; give cash and same for 2-speed Levis, or similar.—Walton, Dawson Sq., Burnley. [X2821]

## B.S.A.

**B.S.A.**, 1916.—Both models in stock, or for immediate delivery.—Moss, Wem. [X3003]

**JULIAN'S**, Broad St., Reading. Phone: 1024.—Immediate delivery of all B.S.A. models. [X2834]

**B.S.A.**, 1915, 4½ h.p., done 3,000, good order, new tyres; £45.—Warter, Littlemore Camp, Weymouth. [X2939]

**B.S.A.**, 1913½, 3½ h.p., vanguard gear, free engine, clutch, good order; £35.—Chas. Eddolls, Alresford, Hants. [1347]

**1913 B.S.A.**, 2-speed, in perfect order; £32; guaranteed, easy payment arranged.—Jones, Garage, Muswell Hill, N. [1213]

**B.S.A.**, 1916 models in stock, model H £64; B.S.A. No. 2 sidecar, £18/18.—Hucklebridge, 133, Sloane St., London, S.W. [X2955]

**1916 B.S.A.**, 4½ h.p., model K; £62; delivery from stock; exchanges.—D. J. Shepherd and Co., Enfield Highway, N. [1523]

**B.S.A.**, 3½ h.p., free engine, 2-speed, wicker sidecar, side door, perfect order; £35 cash, bargain.—James, Stow House, Bicester. [X2777]

**B.S.A.**, 1915, 4½ h.p., 3-speed, countershaft gear, chain-cum-belt, complete; £48; no exchanges.—Laytons' Garage, Bicester, Oxon. [X3059]

**B.S.A.**, T.T., 1914, splendid condition, lamp set, spare belt, £28; roomy wicker sidecar, 1915, 24.—Gardner, Hilldrop, Chipping Norton. [X2828]

**1914½ B.S.A.**, all chain drive, 3-speed, etc., general and mechanical condition excellent; price £46; exchanges.—1, Welbeck St., Darlington. [1481]

**B.S.A.** 1914 Combination, 3-speed countershaft, and coachbuilt sidecar, kick starter, in real good order; £55.—Percy and Co., 337, Euston Rd., London. [1493]

## Increased Exports and Reduced Imports.

**W**HENEVER the financial position is discussed by Cabinet Ministers it is usual to emphasise the desirability of increased exports and reduced imports.

And that is where the matter ends! Yet it is glaringly obvious that to maintain our balance of trade during war time whilst practically the whole of our productive resources are engaged on munitions of war is impossible. But if our leaders are so convinced of the desirability of increased exports and reduced imports, then we can only remark that after eighteen months of war it is high time that they discarded advice and commenced action. The Prime Minister lately asserted that "it is only by the maintenance at the highest possible level of our productive activities and of our export trade and by the curtailment of imports that we can possibly sustain the unexampled burden which has been cast upon our shoulders."

The subject of British motor cycle exports is one we have laboured for months past, and from time to time we have urged certain obvious business plans which suggested themselves as desirable in the present crisis. What has been done by the Government to assist manufacturers in exporting the goods they have produced? Obstacles in the way of British manufacturers supporting the Government's exhortations to increase exports have been mentioned constantly, but from outward indications it is plain that nothing whatever has been done to remove these obstacles. Indeed, the position has become worse. The shipping question has always been a difficulty, and the railway companies now frequently refuse to transport goods to the coast. To turn for a moment from exports to imports. It is generally agreed that Britain is second to none in the production of motor cycles, yet we see constantly batches of motor cycles being ordered by our Allies from neutral countries when England could well maintain the supply.

France and Russia would, we have no doubt, place their orders in this country were the position made clear to them, as it ought to be, whilst there seems to be no excuse whatever for the South African Government placing an order for American-made machines while supplies are available in this country. Those in the know are inclined to smile at the good advice of Cabinet Ministers, upon which they themselves, however, do not act.

When it is remembered that during the eighteen months that this idle talk has been proceeding we and our Allies have imported several million pounds worth of foreign-made motor cars and motor cycles for military requirements which our own workshops were capable of producing, surely it is time to call for deeds, not words.

## Unfit for Service.

**N**OTHING has puzzled us more in connection with recruiting than the number of men who have been rejected on account of some slight physical defect.

Apparently it has been the rule that recruits who were not perfect specimens of manhood were useless to the country in this war. Just why such a drastic rule should have been introduced and adhered to throughout is one of those questions which no business man can answer. An adjutant once told us that he was regularly having to discharge twenty recruits per week on account of hammer toes. These men were sent home, apparently good-for-nothings, and not directed to other channels where their services might be of considerable assistance to the Government. One of many such cases which have come to our knowledge is of a tester employed by a leading motor cycle manufacturer, who first enlisted in a line regiment and was discharged, and after returning to his old firm could not rest, but again managed to enlist in another section, again only to be discharged after a month's service. His original

employer was only too glad to have him back, and he has since been in regular employment, and has never suffered a day's illness. This man is a healthy motor cycle tester, used to constant exposure in all weathers, and the harsh ruling previously referred to has deprived the Government of his services for something like fifteen months. And this is not an isolated case. We contend that such men are of great value to the Govern-

which unaccountably enough have been considered sufficient to render a man useless for military service. No doubt when the organisation of our Army is perfected this sort of thing will not continue, and the

UP IN THE AIR ON A MOTOR CYCLE.

Triumph testers "buck jumping" on road and grass whilst trying to break War Office machines. The lower picture shows a donkey-back bridge. No doubt many readers have experienced the sensation of leaving the ground when crossing such bridges at speed. Ballig Bridge, on the T.T. course, was such another, and spectators are usually thick at this point.

ment if only to release for active service many able-bodied men who are at present employed on clerical work in military establishments or other sedentary occupations, and there are thousands of them. Even men who have joined the most highly paid sections, and who have been examined as motor drivers, have finally found their way into offices when they could quite well have been replaced by men with short sight, weak hearts, hammer toes, and the other slight defects

sooner every man unfit for active service is gathered into the ranks of those to be employed in the less strenuous occupations, to which we have referred, in order to release able-bodied men for foreign service, the sooner will people recognise that our house is at last being put in order. As it is, men holding responsible positions, and whose work is directly for the good of their country, are being taken to fill up the gaps.

## The Alignment of the Sidecar.

THE correct alignment of the sidecar wheel with those of the bicycle is most important, but this fact is not generally appreciated, judging by the number of incorrectly fitted sidecars to be seen on the road. If the wheels are running out of line with each other, not only is the steering adversely affected, but the wear on the tyres is considerably increased. One of the best methods of ascertaining whether the wheels are parallel is to measure the distance between the centres of the treads (with the aid of string or a lath) in the positions shown in the diagrams; if these measurements correspond, the sidecar and driving wheels will be in correct alignment. Many riders maintain that the steering is rendered easier and more comfortable by having the front of the sidecar wheel pointing very slightly inwards, especially in those cases where the sidecar wheel is fitted, as it generally is, a little in advance

of the rear wheel of the bicycle, as the tendency of the former wheel seems to be for it to be splayed outwards slightly.

How to check the alignment of sidecar and bicycle wheels.

### Petrol Prices.

The present position appears to be that the Shell Co. are genuinely short of supplies (they assure us that they provide much more than any other company of the Government's requirements); at any rate, my last order for Shell was only accepted subject to a 50% reduction in the quantity, and still remains unfulfilled. The other companies apparently have larger supplies, and have put up their prices to prevent their stock being exhausted too rapidly. A Portsmouth reader suggests that private owners should subscribe to form a co-operative petrol supply association. He is clearly unaware of the existence of such a society, which provides its shareholders with excellent Roumanian petrol at prices below those charged by the ordinary companies. Its offices are situated at 3, Copthall Buildings, Copthall Avenue, E.C., but I understand that its motor lorries were commandeered at the outbreak of war and that it is still unable to fulfil orders very promptly. Its terms to shareholders are usually about 2d. per gallon below the standard rate, and I can vouch for the quality of its spirit (the Diamond brand) when, and where, obtainable.

### The "White China Knob Test."

Many years ago *The Motor Cycle* published a farcical serial in the silly season, wherein a novice was taught to lay his finger on the sparking plug to trace the presence or absence of current when his engine would not fire, and the test was christened as above. It is really a most useful tip, though I seldom employ it, as I have a constitutional dislike to electric shocks, however mild. However, I was so thoroughly baffled by the behaviour of one of my engines that I tried the dodge last week. The circumstances were as follow. Nine times out of ten the machine would start with consummate ease and run beautifully; but every now and then it would refuse to start at any price. The misconduct occurred indifferently, whether the engine was hot or cold, which suggested that carburation was not the culprit; and if I had sufficient energy to keep on pushing it generally went off at last. However, an evil hour came when I had to call at a house halfway down a 1 in 6 grade; the machine refused to restart up the hill, so I pointed its nose down for gravity to tackle the job. I coasted half a mile with the engine burbling over merrily on bottom gear, but never an explosion. I was in a hurry by this time, so I clenched my teeth, leant down, and pressed a timid finger on the plug. No shock! Off came the contact breaker cover, and the platina were found to be permanently open. Since I freed the bell crank spindle in its bush, starting has been uniformly perfect. I have often encountered cases of the bell crank sticking permanently, but never before have I met one which sometimes stuck and sometimes worked.

### Combined Drive for the Baby Two-stroke.

I have written many parasangs of copy in favour of the belt-cum-chain drive, and still believe there would be no other drive on the market if it were not for those interfering sidecars. If they succeed in substituting the two-chain drive on the higher powered machines as, to my poignant sorrow, they threaten to do, I will yet maintain with my dying breath, if necessary, that the combined drive is absolutely "It" for baby two-strokes. Somebody asked me the other day how often I shortened the belt of my two-stroke. I have had it six months and no knife has yet touched it. Musing on these facts, I happened to strike a dear little baby watersplash about ten feet wide and six inches deep in the middle. Not being in any hurry, I resolved to drive backwards and forwards through the water until the belt spoilt its record and slipped. Much to the mystification of one or two shepherds and keepers on the surrounding moor, I drove backwards and forwards through the splash for a quarter of an hour or so without succeeding in getting a race from the engine. Then the unkind treatment got in its deadly work on the ignition, and, after an eloquent five minutes with that extremely Yankee production, I departed a wetter, but not a wiser man.

### Petroilists, Strain Your Oil.

I had been off "petroiling" for a long period, and rather regret that I have returned to it. The immediate accompaniment was a bad fit of chronic flooding. I examined and cleaned the float needle, only to see the hideous green and yellow stains over half the machine next day; and finally, in something of a pet, I discarded the faulty carburetter, and slung on another which chanced to fit. It ran nicely for two days, and then the stains returned. I decided that the Government must have commandeered all the supply of float needle metal (to caricature our manufacturers' stock war time excuse for defective parts), and on went carburetter No. 3, which also started flooding within forty-eight hours. I began to see daylight, and, seizing my drum of costly lubricant, strained a quart or so through very fine wire mesh. As I thought! The lubricant was full of foreign matter, ranging from hair and fluff to bits of metal filing, and it was these which had wrecked the reputation of three first-class float needles. Gentlemen, the Government have evidently commandeered the supply of oil-straining wire gauze; so haste to your wife's treasure chests, and commandeer her best cambric handkerchiefs unless you wish unstrained oil to spoil the operation of your costly carburetters! In the meantime, my profound apologies to Messrs. Senspray, Brown and Barlow, and Charles Binks, all of whom I would ere now have excommunicated with bell, book, and candle had I been a bishop instead of merely a miserable motor cycling journalist.

## A Plea for the Steerable Sidecar Wheel.

By DOUGLAS LEECHMAN.

**T**HE precise position which a sidecar wheel should occupy relatively to the driving wheel of the bicycle is one which has come up for discussion many times since the sidecar first became a practical factor in motor cycling.

Regarding the combination simply as a front steering, rear driving vehicle, one would say that the side wheel should be co-axial with the driving wheel, so that the two rear wheels may run parallel to one another when proceeding straight ahead and may turn about a common centre when the machine, as a whole, is describing a curve. This is in accord with the well-known theory that all the axes of the wheels of the vehicle should intersect at one point, viz., the centre of the curve which the vehicle is describing.

Starting with the "co-axiality" of the side and driving wheels as a basis, therefore, the next thing to consider is how far the general theory is affected by the special conditions of the case.

### The Position of the Sidecar Wheel.

First, we notice that while the rear wheel of the bicycle is driven the other rear wheel, i.e., the sidecar wheel, is a mere running wheel, and all the propulsive effort is exerted at one side (the bicycle side) of the machine. That side, therefore, is pushing forward, while the road friction and wind resistance, acting as a leverage, tend to hold the other side (the sidecar side) back. There is, therefore, a tendency for the bicycle to run round the sidecar, and this is noticeable in practice by an inclination of the combination to run to the left, supposing, that is, that the sidecar is fitted to the near side of the bicycle. The tendency is not a strong one, because when a wheel mounted on a fixed axle is rolling along the road it has a strong predilection for continuing in the path in which its own plane lies; the road friction resists any deflection to left or right. The rear and side wheels of the combination act in this manner, and so does the steering wheel if it is held rigidly straight. Still, this is only a resistance—it is not an active force tending to incline the machine either to right or left, and so there is still, so to speak, a balance of force tending to run the machine a little to the left all the time it is being driven. This is the natural state of affairs, and one can only give the machine a tendency to run straight while the steering is left free or "hands off" by some artificial means. One method is to set the side wheel with its axis a little forward of that of the driving wheel. This has only a partial effect—it merely increases the distance through which the side wheel must give or skid laterally in order to allow the machine, as a whole, to run a given amount to the left. Even if the side wheel were placed so far forward as to lie by the side of the front wheel, the com-

bination, if given its head, would still describe a curve with its centre on the left—a long, long way on the left, for the curve would be a very big one; but still, there it would be. At the same time, too, such a disposition of the wheels would make it extremely difficult to steer either to right or left, especially the left, when one wanted to do so. In fact, if this device is resorted to at all, the side wheel should be advanced only a very few inches.

Another expedient is to set the sidecar wheel *désaxé* in another sense to the driving wheel, viz., with the outer end inclined a little forward. This is a positive method, as it sets up a tendency to run the whole machine to the right, and, if correctly done, will just balance the tendency to run to the left when the machine is being propelled with the normal force. It may seem rather a barbarous thing to set the side wheel axle off the square in this way, as it involves "spinning" of the side wheel and scrape of its tyre on the road practically all the time. But before condemning it we must remember that in actual practice the combination is always prevented by some means or other from trailing away to the left; it is made to keep a practically true course somehow, even if the two rear wheels are co-axial. The explanation is that the driver consciously or unconsciously inclines the steering wheel a little to the right, and so subjects his front wheel and tyre to the same kind of spinning and scraping as the side wheel has to endure when its axle is inclined in the way just described, though perhaps not to the same degree.

### The Steering Head.

In this connection it is interesting to observe that a sidecar combination should have its steering laid out differently from that of a bicycle. With the latter the casting action secured by carrying the steering axis forward of the point of contact between the front wheel and the road is decidedly beneficial, but with the three-wheeler it is the reverse. For notice what takes place. In running along, say, the side wheel strikes an obstacle; it is thereby relatively slung back, the machine rotating through a small angle having the point of contact between the driving wheel and the road as centre. The effect in front is to swing the steering axis some distance to the left, and the front wheel, pivoting on its point of contact with the road, is thereby deflected to the left also. The arrangement of the steering thus helps the obstacle to slew the machine to the left. This has to be counteracted by the muscular effort of the rider, and on a rough road soon becomes tiring.

If, for sidecar purposes, the steering axis were made to pass right through the point of contact between the front wheel and the road, the lateral

**A Plea for the Steerable Sidecar Wheel.—**

force, acting on the front of the machine when, to put it generally, the progress of the side wheel is obstructed, would have no tendency to deflect the wheel, but only to remove it bodily sideways, and this would be resisted more or less completely by the grip of the front tyre on the road.

Indeed, it might be worth while to carry the modification a little farther, and, in a machine to be used for passenger work wholly, set out the steering with the axis passing a little behind the point of contact. Then the retardation of the side wheel in throwing the front of the machine to the left would deflect the steering wheel a little to the right, and so produce automatically that counterbalancing tendency to steer the machine to the right which the rider now has to produce positively by his own efforts. And with such an arrangement, when the side wheel encountered a more serious obstacle, the steering wheel would be simultaneously slung sharply farther over to the right, and so would produce an instantaneous antidote and maintain a straight course for the machine instead of exaggerating a deviation.

So far as rigid sidecars are concerned, therefore, a slight tendency to run to the left is natural and not so much a fault as an objection. The best way to cure it, if at all, is by bringing back the steering axis, and, failing that, to incline the side wheel slightly inwards; that is, to the right in front.

But even at its best the rigid sidecar is very far from ideal as to its steering, and one asks whether it is not time some real improvement were introduced in sidecar construction—something more radical than the elaboration of the bodywork, and something more intelligent than the lowering of the centre of gravity at the expense of the strength and lightness of the frame.

And the candid critic was right when he said that the side wheel of a sidecar ought to be either driven or steered. Driving the side wheel is by no means an impossibility, but it is a much simpler job to steer it, and steer it properly, if one pays due regard to the circumstances of the case.

**The Advantages of a Steerable Wheel.**

As long ago as 21st October, 1908, Mr. B. H. Davies—writing in *The Motor Cycle* on “Which is the best sidecar?”—gave his verdict in favour of the steerable wheel type, and said:

“Mr. R. G. Booth and myself concur in claiming for it the following advantages:

- “1. No sideslip whatever, even with plain tyres.
- “2. Perfect sociability.
- “3. Takes any corner safely at speed, right or left.
- “4. Will always come up to the crown of the road off the camber quite obediently.

“5. A minimum of side pull, hence minimum of power required to pull it.

“6. Safe to ride solus, or easily driven from chair.”

And in *The Motor Cycle* of 1st July last a new patent is reviewed in which the side wheel is described as being so mounted that it is deflected to right and left in unison with the steering wheel of the bicycle.

Now one great merit of the steerable sidecar of 1908 was that the side wheel was set about equidistantly from the other two wheels—that is, half-way along the side of the bicycle—so that its axis came well under the load. The weight of the passenger was about evenly balanced over it, and so there was no more strain on the front of the frame than on the back, and breakages due to this cause were unknown.

We have already seen that if the sidecar wheel is at the back it should, broadly speaking, be co-axial with the driving wheel when running straight and remain so when rounding curves. But suppose for a moment it is a back wheel that has been lost, and that the side wheel is forward alongside the steering wheel. Then the sidecar wheel should be deflected through a rather less angle than the front wheel of the bicycle when turning to the right, and through a rather greater angle when turning to the left, so that both the front axes intersect at the same point on the rear axis, which point is also the centre of the curve being described by the combination as a whole. That is, the two front wheels should be deflected in this case in the same way as in a complete motor car.

A flexible sidecar of American design, so constructed that both bicycle and sidecar wheels lean over together in taking a corner.

From these two extreme cases it is not difficult to see that when the side wheel is placed amidships, the steering connections should be so arranged that, on the average, the side wheel should be deflected half as much as the bicycle steering wheel. There is not much trouble about this. Put briefly, the result is attained by making the steering arm of the side wheel double the length of the arm fixed to the fork carrying the front wheel.

In a motor car the intersection of the axes on the curve centre is attained approximately by setting the steering arms (or, more correctly, the lines passing through the wheel pivots and the pivots of the steering crossbar) so that they are directed towards the centre of the back axle. This sets up the necessary differential movement of the two wheels.

To apply the same principle to the case where the sidecar wheel is half-way along the machine may seem rather an awkward proposition at first. But it may be solved fairly simply if the side wheel is considered as having been moved back through an angle from the forward position. Then if the steering arms are swung round through the same angle they will be practically right for the new condition of things.

# NEW MODELS

## ILLUSTRATED REVIEWS OF 1916 PRODUCTIONS.

### THE IXION TWO-STROKE LIGHTWEIGHT SIDECAR OUTFIT.

**A** POINT which makes all the difference between a really good and an indifferent machine is, to a very great extent, undoubtedly, the attention given to detail. There can be very few machines on the market which have received more attention in this respect than the little double-purpose lightweight manufactured by the Ixion Motor Manufacturing Co., Birmingham. This machine, although only fitted with a  $2\frac{1}{2}$  h.p. two-stroke Peco engine, has been specially designed for light sidecar work, which work, judging by users' appreciative remarks, it does extremely efficiently. The manner in which the sidecar chassis is constructed and the method of attachment to the

to a channel cast in the cylinder wall, whence it is conveyed to the various parts of the engine. The magneto is an E.I.C., and is situated behind the cylinder, and is chain driven. The latest pattern Druid, Mark IV, front forks are now fitted as standard, while, contrary to the other Ixion models, this machine is fitted with a three-speed hub gear. This type of gear, so far as heavy machines are concerned, is now almost extinct, its death knell having undoubtedly been sounded by the performances of certain types of this gear in both the Senior and Junior Tourist Trophy races in 1913, and in spite of the fact that the Junior race of that year was won by a machine fitted

with this type of gear, it has never since that time been really popular. There is, however, undoubtedly still a future for it in connection with small machines like the Ixion, for these gears possess many advantages which are entirely absent from the countershaft type. For instance, the beautifully sweet and simple change that any novice can make equally as well as riders of long standing, its absolute silence on all gears, and also the benefit of a simple adjustable pulley must not be forgotten.

Neat footboards are now fitted to this model, and the rear belt rim brake is operated by a heel pedal situated on the left. A short extension pipe from the silencer with a fishtail outlet is also fitted. The two main sidecar connections are incorporated with the cycle frame and brazed thereto, as are all other fittings such as brake attachments, gear-change lever, and so on.

#### The Sidecar.

The sidecar chassis is designed to give great rigidity, yet to be as light as possible. The main frame is in the form of a rectangle, while the front cycle connection, in addition to being attached to the front member, is also carried direct to the rear axle of the chassis, so forming a triangular brace, not only rendering the construction very rigid, but the propelling power is taken to the back of the machine, thus reducing to a minimum the torsional side strain always present in drawing a sidecar. The connections are very neat, and are also very quickly detached, this being easily ac-

bicycle are most noteworthy. The chief aim throughout the construction of both machine and sidecar has been to eliminate to the greatest possible extent all clips and joints, this not only producing great rigidity, but enhancing the appearance to a very considerable extent. The appearance can be judged from the illustrations.

#### The Bicycle.

The bicycle frame is most substantially made, the steering head is long and is braced by a webbing, while the top tube is dropped at the rear to enable a low riding position to be obtained. The  $2\frac{1}{2}$  h.p. Peco two-stroke engine has a bore and stroke of  $75 \times 79$  mm. (349 c.c.).

Lubrication is carried out by means of a pump sight feed lubricator, the pump now being placed at an angle to render it more easily operated from the saddle. From the sight drip the oil is conducted

Latest model Ixion lightweight passenger outfit. The engine is a two-stroke  $2\frac{1}{2}$  h.p. Peco, and drive is by belt direct to a Sturmey-Archer three-speed hub gear. The latest pattern Druid fork is fitted.

**few Models.—**

completed in three minutes. The rear connection consists of a metal ring formed on the rear axle of the chassis, which fits over a projection situated in a vertical position on the rear cycle stays, and is locked in position by a stud which screws into the centre of this projection. The front connection fits through a loop formed by a lug on the down tube, and is secured when in position by a large nut, the third connection being the usual diagonal tube from saddle pillar to the sidecar axle. The alignment of bicycle and sidecar is pre-arranged, and so adjustable or telescopic tubes are not provided, as the bicycle frames are built to a master sidecar chassis, while the sidecar chassis are built to a master frame. Brazed joints are reduced to a minimum by means of elaborately forged lugs. The neat body has been improved in appearance for this year by more sweeping curves, and the introduction of a door. It is supported on C springs, which are attached to the chassis on lugs brazed thereto. The shackles on which it is supported are made from forgings, and have a large bearing surface. Many improvements in the reduction of lugs and joints on the sidecar chassis are to be introduced directly the supply of the necessary forgings can be obtained, and these, as everyone knows, are at present extremely scarce. Of course, these little outfits are intended really for only light work over reasonably good road surfaces, but that they are up to almost any work was indicated by a letter which was read to us while at the Ixion works from a satisfied customer who had toured North Wales on one of these diminutive outfits with his wife and little child.

**A SPORTING POWERPLUS INDIAN.**

**Model G, with Rigid Frame and T.T. Bars.**

**A** MACHINE which should appeal to the sporting motor cyclist who delights in riding a powerful twin solo is the Model G Powerplus Indian. This model might be described as a T.T. model, as it has a rigid frame and T.T. bars as standard. It is a machine, however, which would be adequately suited to almost any amount of serious touring, fitted as

Latest model two-stroke Calthorpe. It is referred to below

it is with a three-speed gear box, clutch, and kick starter.

The latest model Indian Powerplus engine is fitted; this has a bore and stroke of 79x100 mm. (990 c.c.), and a nominal power of 7 h.p., though these engines have developed as much as 15-18 h.p. on the dynamometer test. Stand, carrier, folding footboards, 28in. x 3in. wheels, wide mudguards, and the famous Indian cradle spring front fork practically complete the ordinary specification.

**The Change Speed Gear.**

The three-speed gear box has been somewhat altered since it was first fitted to Indian models in 1914. Originally only one sliding gear wheel was used, the other two gears being engaged by means of dog clutches. This method, however, necessitated all the gears rotating idly and in mesh when top gear was in engagement, thus causing a certain amount of undue wear and noise. To overcome these slight defects, the sliding member now consists of the first and second speed layshaft pinions, while the top speed is still engaged by means of a dog clutch incorporated in the second-speed pinion. By this method it will be seen that when the top gear is engaged the layshaft will still revolve, but will not be meshing with any of the other pinions, thus ensuring more silent top-gear running. The multiple-disc clutch is operated on this model by means of a pedal, the return motion being actuated by the aid of a spring, so that the action is similar to the clutch motion on a car. In

order to facilitate clutch operation when riding solo, a hand lever is interconnected with the pedal mechanism in such a way that either method of operation may be used at will.

**The Engine.**

It will probably be known by many that the Powerplus Indian engine is one of the greatest departures from their previous practice that the Hendee Manufacturing Co. have made for some years. The chief variation from previous models is the arranging of the valves side by side, and the fitting of the timing mechanism in a separate timing case outside the main crank case. This has rendered the outside of the crank case extremely neat, as both the valve and magneto timing mechanism is now enclosed by one cover.

**THE NEW CALTHORPE TWO-STROKE.**

**I**T is expected that the man's model of the new two-stroke Calthorpe will be ready for delivery this month, and therefore a short resumé of its main features will not be out of place. The lady's edition of this machine was described and illustrated in our issue of October 7th, 1915, and the only difference in design is in the frame, tank, and dressguarding.

A feature of the new two-stroke Calthorpe is the sloping "Zeppelin" type tank that is also fitted to the 4 h.p. twin. Such a design undoubtedly enhances the appearance of the machine.

The two-stroke engine is of 245 c.c., the dimensions being 67 mm. x 69 mm. An Amac carburetter is fitted to the off side of the engine, and the magneto is located on an aluminium platform fixed to the rear of the crank case. The petrol system of lubrication is not employed on the two-stroke Calthorpe, but oil is led by a copper pipe to a groove encircling the cylinder. From this groove the oil finds its way through holes in the cylinder walls directly on to the piston.

The Enfield two-speed gear is now a standard fitting to both this and the lady's model. The final drive is by a 3in. Dunlop belt. Druid forks and 26in. x 2in. Moseley tyres are also standard fittings.

The two-stroke Calthorpe may also be purchased as a single-gear mount. The 1916 catalogue is now ready.

Sporting edition of the 1916 model Powerplus Indian. The standard model has a spring frame and touring handle-bars.

# A New Dunkley Passenger Model.

5 h.p. Twin-cylinder Four-speeder for Sidecar Work.

**F**OR sidecar work Messrs. Dunkley, Ltd., have placed on the market a substantially - built, medium-powered twin, made up for those who require the combination for fast touring or for use where the main road gradients make power the first requisite.

## Four Speeds a Standard Fitting.

The engine is a 5 h.p. twin J.A.P. with the magneto on a malleable bracket in front. It is fitted with an Amac carburetter. From the left-hand side a roller chain takes the drive to a Jardine four-speed gear box, to which is fitted a pulley of large diameter for the 1 1/2 in. rubber belt. The belt rim and pulley are almost the same size, thus providing a very large area of engagement for the belt, and so reducing the likelihood of slipping to a minimum. Further, the big gear box pulley makes it possible to use a large belt. As the Jardine four-speed gear has its driving shaft above the layshaft, the box is somewhat deep, and, were the special upturned bottom bracket not fitted, might reduce the ground clearance to a dangerous degree. This special bracket makes the wheelbase of the machine appear longer than it really is, and several people have been convinced only by measurement that the length is no more than 56 in.

Owing to material difficulties the sidecar lugs of the frame are separate castings brazed into position, instead of forming a part of the head and tank tube lug or the rear tank tube lug respectively, as was designed originally. There is a good length of tube between the two thrust bearings on the head. The engine is carried by four plates bolted in pairs respectively to the seat pillar tube and down tube.

There are two wooden aluminium covered footplates hung from horizontal tubes by strip steel pieces, and the right-

5 h.p. twin-cylinder four-speed passenger outfit—the latest Dunkley production.

hand footplate eventually will receive the brake pedal, now mounted as a temporary fitting on the horizontal tube supporting the plates. Similarly, the rear contracting brake is but temporary, as an expanding brake is to be fitted later on, the design following that of the rear brake on the Dunkley cycle car.

Druid spring forks, with the additional springs between the fork tubes and alongside the head, are fitted, and a wide mudguard is obtained by the aid of extensions secured to the normal mudguard's edge. In front is a 650 x 65 mm. three-rib Hutchinson tyre, and at the back a 650 x 75 mm., so that here at least is ample tyre surface for the work. Both wheels are strongly built with substantial rims to prevent damage from abnormal pot-holes, and thick spokes to deal with the weight, while the rear hub has ordinary cup and cone ball bearings, that at the front having roller bearings.

Most people will have suffered from

mudguards with a knack of detaching themselves in portions at a time, and therefore will rejoice to see that on this machine the possibility of trouble is small, a thick steel strip running right round the circumference of the guard and being doubled to form the rear stand clip; on the way the carrier also is held by this strip, while at intervals of about three inches the guard is held by rivets. In front of the Dixie magneto there is a metal mudguard to keep away that mud which escapes the valances of the front guard.

Obviously this is a machine for rough work as well as for ordinary touring, and one regrets that circumstances prevent its debut in something as strenuous, say, as the Scottish six days trials.

## A WATSONIAN SIDECAR AMBULANCE.

**A** SIDECAR body combining an ambulance and medical supply carrier is in course of construction by Messrs. The Watsonian Folding Sidecar Company, Birmingham. It consists of a long box about two and a half feet wide and possibly six feet long, composed of three-ply wood and fitted with a hinged lid. This box will be attached to a standard Watsonian chassis on very carefully designed springs in such a manner that the weight will be equally balanced and distributed over the back axle. Within the box an arrangement will be fitted upon which a stretcher will rest, so that it will be separately sprung. In order to provide a cover when a patient is being carried waterproof canvas will be fitted to the lid of the box, which will be held in an open position by means of stays in such a manner as to provide ample protection. When not used for patient carrying the body may be used as an ordinary box carrier, there being a large amount of space beneath the stretcher, even when this is in position. These motor cycle sidecar ambulances are not used with the British troops, the Red Cross maintaining that the springing is insufficiently good; but with the French and Italians they have proved quite serviceable.

A three-quarter view of the new 5 h.p. Dunkley.

## LATEST BRADBURY MODEL.

A 2½ h.p. Single-cylinder Experimental Medium-weight.

**A** NEW Bradbury medium-weight is at present undergoing tests when Government work, with which Messrs. Bradbury and Co. are at present very busy, permits. It is not expected that the new model will be ready for the public until after the war, as the Government has taken up all their productive power. The engine of the new model is somewhat like the 3½ h.p. single-cylinder Bradbury, as the crank case forms part of the frame in the same way as in that machine. One side is detachable, in order to remove the flywheels when

A new Bradbury single-cylinder model scaling 160 lb. The bore and stroke are 74.5 × 80 mm. = 348 c.c.

necessary, and held in position by means of bolts. The cylinder dimensions are 74.5 mm. × 80 mm., capacity 348 c.c. It also has side by side valves, and a detachable head, which is held in position by two long bolts fore and aft. These also secure the cylinder to the crank case by means of a strong bridge piece. The finish of the cylinder is dull nickel plate. The Dixie magneto is situated in front, and is chain-driven, while the usual internal exhaust valve lifting mechanism has been discarded and a neat external lifter fitted. Both valve tappets are adjustable.

A two-speed countershaft gear box is fitted while a combination of chain and belt forms the transmission.

The frame is somewhat unorthodox, the top tube being perfectly straight from the head to the rear down tube. The saddle-pillar lug is situated behind this tube, but placed somewhat below the level of the top tube, so as to obtain the lowest possible saddle position. The steering head is long in order to obtain good steering, and is supported by strong webs. The rear brake, operating on the inside of the V of the belt rim, enables the rear wheel to be removed without disturbing the adjustment of the brake. The weight of this little mount is only 160 lb., including toolbag and tools, while, as will be observed from the illustrations, the appearance is decidedly neat and attractive.

Power unit of the new chain-cum-belt driven Bradbury. The usual Bradbury system of building the frame and crank case as a unit is retained.

## A NOVEL SIDECAR BODY.

**T**O obtain lightness, combined with the neat appearance presented by the coachbuilt sidecar, a new model G.K. body has been introduced. This,

coachbuilt pattern. The appearance is quite pleasing, and, with the growing use of sidecars on light and medium weight machines, should meet a

good demand. G.K. sidecars are made by the G.K. Sidecar Co. at the Lorenzo Works, Lorenzo Street, Pentonville Road, N.

G.K. lightweight canework sidecar covered with patent leather, so presenting the appearance of a coach-built body.

whilst bearing the outward appearance presented by the average coachbuilt type, is really made of canework, the latter being covered with patent leather, thereby obtaining the resilience, easy riding, and light weight of the canework body, combined with the neat appearance, convenience for cleaning, etc., of the

A new belt-driven Bianchi motor bicycle—an Italian production. The engine is a 3½-4 h.p. of 75 × 112 mm. bore and stroke, giving a capacity of 495 c.c. A three-speed gear box is embodied with the crank case. Previous models have been chain-driven. It may be noticed that there are quite a number of British fittings on this machine, which throughout closely follows British design.

## Extracts from Overseas Letters.

### The Opinions of Motor Cyclists scattered all Over the World.

**T**HIS issue being the first of the month we give below a further selection of extracts of the opinions and impressions of our readers in different parts of the world. We commend these communications (many of which are immensely practical, voicing as they do the studied judgments of seasoned riders on the question of design of motor cycles) to manufacturers, and feel confident that a consideration of the opinions may prove beneficial. The question of design, however, does not form the subject of every letter, as will be seen, though it is a fact that one of the two points which appear to constitute the chief grievances of Overseas readers concerning British machines is the question of springing. The other contentious subject is the question of charges by agents, the Overseas buyer always comparing the price he is asked with the British price. This, however, is not altogether fair, even after adding freight charges and duty, for there are many points which enter into the agent's settlement of terms, such as the question of placing orders and deposits long beforehand, the extra amount involved, and the risk run.

The letters this month, it will be noticed, emanate mainly from British Dominions, and include a communication from Samoa, one of the German possessions in the Pacific Ocean captured during the

war. The major portion come from Australia (especially New South Wales) and New Zealand, in which countries, as our pages have already shown, the motor cycle is immensely popular.

We have endeavoured to select opinions which give the greatest diversity. Many a true Britisher notes with misgiving the hold which is being taken of the trade in our Colonies by American manufacturers, and frequently expresses the hope that after the war British makers will concentrate their attention on Overseas trade. We have no doubt whatever that they will do so, for with the more complete equipment of their works with the latest labour-saving machine tools, the expense of which has been directly occasioned by the war, our makers at home will be better able to produce machines in quantities, and may have enough and to spare for the home market, which will automatically cause them to turn their attention abroad. Again, by reason of the valuable experience which is being obtained in the war zone, the design of our motor cycles will be such that they will be eminently suitable for the exacting conditions of Overseas service.

Finally, we may express our appreciation of the continuous inflow of letters from enthusiastic readers, and invite further communications from motor cyclists wherever they may be located.

MOTOR CYCLISTS  
AT THE CAPE.

Members of the Cape Peninsula (S.A.) Motor Cycle Club, photographed on the occasion of the annual run to Hout Bay, near Capetown.

# Extracts from Overseas Letters.

## "The Motor Cycle" appreciated in the South Seas.

MAJOR W. M. KAY, a member of the New Zealand Expeditionary Force, stationed in Samoa, writes: "A copy of *The Motor Cycle* which has just reached me is the first I have received since the war began. I therefore anticipate a pleasant half-hour or so between whiles, as it were. I have been a subscriber since I have been in possession of a motor cycle."

## Why Motor Cycles are becoming Popular in Africa.

MR. H. N. LLOYD, Pretoria, South Africa: "The public are fast realising the numerous advantages provided by a motor cycle in a country such as this, where horse and cattle diseases are rife, where distances to be covered between towns are very lengthy, and the roads and paths, though far from good, are seldom impossible for the modern motor cycle."

## Factory Control of Prices.

MR. J. E. KNAGGS, Pretoria, South Africa: "I would suggest that in order to stop the excessive prices charged by agents the manufacturers should establish factory controlled depots, and not leave the decision of the sale prices to agents, who take advantage of the popularity of certain makes to increase their profit per machine. Advertisers in *The Motor Cycle* should always quote prices for Overseas. This would enable us to import with the least possible delay."

## A Most Satisfactory Machine.

MR. A. T. BEAULEY, Poonabaran, N.S.W.: "The machine I now ride is a 3½ h.p. T.T. Abingdon. It was one of the first of this make to come to New South Wales, and is now five years old, and must have covered about 20,000 miles since it was new, and so far has never compelled me to walk. I consider this a fine performance in Australia, where the conditions are of a very varying nature. I have sometimes ridden 100 miles in three and a half hours when the temperature has been between 105° to 110° in the shade, and have never noticed any signs of overheating. Mudguards which may be very efficient in England are frequently no use whatever out here. They require a much greater clearance than is usually allowed, and the side flaps are very little use."

An officer of the motor cycling corps of the Danish Army mounted on his two-stroke 2½ h.p. Royal Enfield.

## "The Motor Cycle" in Uganda.

MR. F. G. GORTON, Kampala, Uganda: "I have only been motor cycling a year, and have in that period succumbed to your paper. I am renewing my subscription, as it is an absolute necessity in an isolated country like this to have such a paper near at hand for information and advice."

## Reinforced Frames Desirable.

MR. G. L. BETTS, Burwood, N.S.W.: "Specially reinforced frames are desirable out here, as the country roads are very bad at times. The best and easiest method, to my way of thinking, is to braze a piece of flat steel about one-eighth of an inch thick in the tubing on its edge from lug to lug."

## A Ground Clearance of 5in. Desired.

MR. W. THIN, Canterbury, New Zealand: "This district (Canterbury) is fairly level, and most of the roads passably good, so that I think almost any of the standard makes of machine are suitable, though it would be an advantage to have the magneto placed behind the engine and as high as possible, as we have often to cross water-races which flow across the road. Mudguarding should be better, and ground clearance not less than five inches."

## Not much Choice of Routes.

MR. S. C. DELANEY, Kimberley, South Africa: "I have found my three-speed Hazlewood most satisfactory for the roads here. I simply use my machine as a means of transport to and from the office. There are only two roads out of this town, one to Boohog, Orange Free State, and one to the Modder River, so you see we have not much choice of routes for pleasure rides."

## "Motorecyclitis" in New Zealand.

MR. D. HANCOX, Ngaio, Wellington, New Zealand: "A friend and I are both affected with that common disease 'motorecyclitis.' We have many diseases in these healthful isles, but the aforementioned one is even worse than small-pox or even plague, by the way that those affected talk of their experiences."

"This small suburb, which lies about three miles from Wellington on the Manucoat line, is accessible from Wellington by road only through the Kaiwarra Gorge. Owing to insufficient train service to and from town nearly half the male portion of the community are all-weather motor cyclists. The Gorge portion of our daily route is steep, narrow, and has a very bad surface. To make matters worse, every winter sees the whole length of the Gorge portion of the road (a distance of 1½ miles) metalled, which is left to be rolled in by the traffic."

## WITH THE CANADIANS TRAINING IN TORONTO.

Pte. A. T. Walker, despatch rider attached to 97th Canadian Batt., and Sgt. Ward, of the 12th York Rangers. The sidecar outfit is an American-Excelsior.

## Extracts from Overseas letters.

## Spring Frames an Attraction.

MR. CLIFFORD LONG, Auckland, New Zealand: "Apart from the price, the American machines seem liable to become popular here on account of their large wheels, superior springing, and general suitability to our roads."

## Prices of Spares.

MR. H. M. LAWRENCE, Wellington, N.Z.: "One can obtain very few spares out here for British machines, with the exception of one or two of the leading firms, and then the price is very high. On the other hand, spares for American machines can be obtained easily and at cheap rates."

## Locally made Spare Parts.

MR. J. B. WESTWOOD, Sydney, N.S.W.: "The difference in prices asked for some of the leading British makes out here compared with the American is very great. The worst fault to find with agents out here is their neglect to have spare parts made locally. If they suddenly find they are out of stock of any part, the cost of making them locally is usually rather more than those received from the makers; otherwise we are kept waiting until the spares arrive."

## Sidecars a Weak Point.

MR. T. S. TAYSON, Maritzburg, Natal, S. Africa: "The usual run of sidecar chassis is nothing like strong enough for the rough roads out here. Breakages are very frequent. My present machine, an A.J.S. combination, seems perfection, as in 12,000 miles practically the only trouble has been with the sidecar springs and shackles."

## A Reader's Ideal Machine.

MR. G.W.A., Gilgandro, N.S.W.: "My ideal machine for work here would have a horizontal twin engine of about 2½ to 3 h.p., very easily accessible, and a three-speed countershaft gear with chain and belt drive, the chain to be enclosed and the belt pulley to be very large, about 8in., and adjustable. The frame should be sprung fore and aft in a similar manner to the Indian, and made of heavy gauge straight tubes, if possible, like the Scott. The wheels must be fitted with extra heavy rims, as the present kind kink and crumple up in no time; heavy spokes and 3in. tyres are also necessary. There should be at least 2in. clearance between mudguards and wheels. Handle-bar-operated clutch and gear controls are also desirable features. The clearance between the lowest portion of machine and ground should not be less than six or seven inches."

## Notes and News from Overseas.

## Racing in Western Australia.

TWO or three months ago we mentioned the novel racing track, in the form of the dry bed of a lake, used during the dry season by the Goldfields Motor Club of Western Australia. Lake Perkolilli, as it is known, is about twenty-two miles from Kalgoorlie, and a short time ago the club held their fifth picnic and sports meeting thereon. The Sick and Wounded Soldiers' Fund greatly benefited by the success of the gathering.

Racing resulted as follows:

## FOUR MILES OPEN HANDICAP.

- |                              |                         |
|------------------------------|-------------------------|
| 1. C. Lewis (7 Indian), scr. | 3. J. Helnr (3½ Singer) |
| 2. A. E. Geere (2¼ Douglas). | Winner's time, 5m. 57s. |

## TEN MILES.—4 H.P. MACHINES AND UNDER.

- |                             |                          |
|-----------------------------|--------------------------|
| 1. C. Lewis (3½ Triumph).   | 3. J. Helnr (3½ Singer). |
| 2. A. E. Pike (3½ Triumph). | Winner's time, 11m. 20s. |

## FOUR MILES.—TOURING MACHINES.

- |                            |                          |
|----------------------------|--------------------------|
| 1. A. McDonald (4 B.S.A.). | 3. C. Long (3½ Douglas). |
| 2. O. Parker (2¼ Douglas). | Winner's time, 4m. 57s.  |

## FOUR MILES.—3½ H.P. AND OVER.

- |                               |                             |
|-------------------------------|-----------------------------|
| 1. T. H. Rnsell (3½ B.S.A.).  | 3. A. E. Pike (3½ Triumph). |
| 2. L. Pilkington (3½ B.S.A.). | Winner's time, 4m. 21s.     |

## FOUR MILES.—PUBLICANS' PURSE.

- |                             |                          |
|-----------------------------|--------------------------|
| 1. A. E. Pike (3½ Triumph). | 3. J. Helnr (3½ Singer). |
| 2. C. Lewis (7 Indian).     |                          |

## FOUR MILES FINAL HANDICAP.

- |                            |                                |
|----------------------------|--------------------------------|
| 1. A. McDonald (4 B.S.A.). | 3. A. Williamson (3½ Triumph). |
| 2. O. Parker (2¼ Douglas). | Winner's time, 4m. 35s.        |

## The Victorian "Jungle."

Certain American newspapers, and in particular the advertisers therein, are notorious over here for, what appears to the British, the extravagant, and at times amusing, language used. A typical example of what we mean is the advertisement of the makers of the magneto used by Erwin Baker in his 1,000 miles Victorian road record. "Warhorse Baker," we are told, "added another world's record to his string when he covered 1,000 miles of Australian brush-strewn, jungle-like roads in 21h. 3m." We did not know until now that there were "brush-strewn jungle-like roads" in Victoria, though the writer has a limited amount of personal experience of motoring in that State of the Commonwealth.

## Commercial Use of the Motor Cycle.

As indicating the spread of the motor cycle for commercial purposes in the United States, it may be noted that the People's Gas Light and Coke Co. of Chicago have just acquired forty-five Harley-Davidson machines. These will be used by the company's collectors, travellers, and mechanics.

## American Magneto Company's Profits.

The Splittorf Electrical Co., of Newark, New Jersey, known in this country as the makers of the Dixie magneto, have had a successful financial year. During 1915 a net profit of 745,107.55 dollars was made, this being nearly twice as much as the total net profit for the year ending December 31st, 1914. Needless to say, the demand from Great Britain for American-made magnetos, due to the war, has had a lot to do with this satisfactory (from the shareholders' point of view) state of affairs.

## Canadian Import Duty.

The import duty before the war on motor cycles imported into Canada from the United States was 35%. Since the outbreak of war an additional 7½% war tax has been made, and now the latest rumour is that the latter is to be doubled. Thus, there is a prospect of 50% having to be paid on American machines imported into the Dominion.

## N.S.W. Trial.

The Bathurst, Orange, and Lithgow (New South Wales) motor cycling clubs have held an inter-team trial, consisting of a 122 miles speed-judging test. First place was secured by a Bathurst rider, C. A. Gregory (6 h.p. Matchless).

Start of the Goldfields (W.A.) Motor Club's 100 miles reliability trial. The machines, which were all British, included six B.S.A.'s, two Triumphs, a Douglas, Enfield, and a Singer.

# "The Motor Cycle" Recruiting Section.

Immediate Vacancies in the M.M.G.S. The Position of R.E. Despatch Riders.

THE response to the appeal for recruits in the last issue of *The Motor Cycle* was no less than anticipated, the fact of practically all the different Army motor cyclist sections having been closed for some time causing men to seize the first chance that cropped up of vacancies in a similar section. The number of men at present required by the Motor Machine Gun Service is of course, limited, but the need is urgent, and only men who can join up immediately may be accepted. Something like 260 forms of application such as appeared in our last issue have been filled up and returned, but in many cases the applicants had omitted to mention their age or Group No., and frequently, in the case of married men, it was stated that they would join when their Groups were called up. Under this arrangement, however, only a few men can be accepted at present, as the vacancies which now exist must be filled with men who are ready to join at once.

## The Case of Single Men.

The Editor regrets that he has been unable to do anything for single men who have been called up under the Group System for a certain date, but it is probable that the War Office may later arrange for their transfer to the M.M.G.S. We hope to make a further announcement on this subject in a later issue.

A number of mechanics have offered their services, but there are no vacancies for this class of recruit at present, only sidecar drivers and gunners being required. The particulars appeared on page 188 last week.

To-morrow (Friday) afternoon, from 2.30 to 4 o'clock, Mr. Geoffrey Smith will be in attendance at the Recruiting Office, Little Park Street, Coventry, and will accept there and then experienced motor cyclists who are able to join up at the Training Centre at once. Railway warrants have been issued to motor cyclists scattered all over the United Kingdom, whose particulars were in order, but any other married men of good physique, either attested or unattested, and who are sidecar drivers, will be considered if they turn up at the time and place mentioned above. Applicants should bring their Reserve cards with them, together with marriage certificate and birth certificates of children (if any).

Should the number of suitable applicants exceed the vacancies which exist, a further waiting list will be formed in anticipation of further demands for men.

## FROM SOUTH AFRICA TO ENLIST IN M.M.G.S.

A NEW recruit for the M.M.G.S. is Cyril E. Barnard, who only arrived home from S. Africa a few weeks ago. One of his brothers, Eric Barnard, is a captain in the 7th Gloucesters, and the other, George, will be remembered by many as the winner of *The Motor Cycle* Cup at the Khaki meeting at Brooklands last August. George Barnard holds a commission in the R.E., and is at present in Egypt.

## R.E. DESPATCH RIDERS.

### Central Office Announcement.

SINGLE men of Groups 14 upwards whose names are already on the waiting list are authorised to enlist in the Motor Cyclist Section of the Royal Engineers when their particular groups are called up. It is to be regretted that there are no vacancies for men in Groups 10, 11, 12, and 13, but it is hoped that they will be able to arrange their transfer to other motor cycle branches of the Army.

In response to continued enquiries, there are still no vacancies for despatch riders in the Royal Engineers section,

the waiting lists being rather lengthy, and we also understand that sufficient motor cyclists have been obtained to satisfy the present requirements of the Royal Flying Corps.

## SOUTH MIDLAND DIVISIONAL AREA WAITING LIST.

ALL motor cyclists on the waiting list of the South Midland Div. Area are requested to notify Sec.-Lt. H. Smith, Secretary Motor Cyclist Reserve Committee, 6, Brynland Avenue, Bishopston, Bristol, immediately they are called up under the Group system. They should at the same time forward their "Group" and "Registration" numbers.

An R.F.C. motor cyclist, somewhere in the Midlands, calls at the village post office for the parcels post. The outfit is a P. and M., this make being used exclusively by the Royal Flying Corps.

## TIME TO LIGHT LAMPS

GREENWICH TIME.

March 2nd	...	6.8 p.m.
" 4th	...	6.12 "
" 6th	...	6.16 "
" 8th	...	6.19 "

### Our Spring Number.

The annual spring number of *The Motor Cycle* will this year appear on Thursday, April 13th, a week before the Easter Holidays. All our regular writers will contribute features to this issue.

### A Club's Honour List.

There are now 154 members of the North-Eastern Automobile Association whose names have been reported as on active service, though there are probably many more about whom information has not yet been received.

### New Road Board Grants.

The Road Board have informed county authorities that, in view of the desire of the Ministry of Munitions to encourage the use of refined tar so as to maintain the supply of distillation products for high explosives, and also with a view to protect important roads from disintegration, the Board have been authorised by the Treasury to make new grants and loans to an aggregate amount of £200,000 towards the work of surface tarring, pitch grouting, and tar macadam.

### Scottish Lighting Regulations.

New lighting regulations for Scotland have been issued under an Order dated February 9th, 1916. In the following districts lamps not exceeding 12 c.p. and dimmed by one sheet of tissue paper are the limit. The parishes hereinafter named and that part of Scotland which lies to the south of a line passing from the coast of Aberdeenshire to the west coast of Argyllshire through the said parishes, and all other areas in Scotland which are within six miles of the sea\* and are not included in the foregoing areas:

Counties.	Parishes.
Aberdeen	Aberdeen, Peterculter, Drumoak,
Kincardine	Dornie, Glenbervie, Fordoun,
	Marykirk.
Forfar	Logie Pert, Dun, Brechin, Kinnell, Guthrie, Kirkcubbin, Dunnichen, Forfar, Glamis, Bessie and Nevay, Newtyle, Kettins.
Perth	Abernyte, Kinnaird, Kilspindie, Stone, Redgorton, Tibbermore, Forvie.
Kinross	Orwell, Fossoway.
Fife	Saline, Culross.
Clackmannan	Clackmannan, Dollar, Tilliecountry, Alva.
Stirling	Logie, Stirling, St. Ninians, Garngunock, Kippen, Drymen, Buchanan.
Dumharton	Arraigar, Luss, Row, Rosneath.
Argyll	Dunoon, Inverchaolain, Kilfinan, Kilmacdonnell.

\* Within six miles of the sea\* means all places within six miles of the sea or the navigable waters of any estuary.

## SPECIAL FEATURES

A PLEA FOR THE STEERABLE SIDECAR.  
OPINIONS FROM READERS OVERSEAS 1916 MODELS.

### The National War Funds.

At the week-end the principal war funds stood as follows:

The Prince of Wales's National Relief Fund (£2,978,000 distributed)	£5,755,612	0	0
The Queen's Work for Women Fund	168,494	11	6
Fund for the Sick and Wounded	3,394,131	0	0
Tobacco Fund	100,532	0	0

### North-Eastern A.A.

The annual general meeting of this Association was to be held yesterday (Wednesday) in Newcastle-upon-Tyne. The meeting of the motor cycle section was to follow. The latter has been practically moribund during 1915 owing to the war.

### A Small Horizontal Twin.

In our next issue we shall describe a particularly interesting machine, the engine of which is a horizontal twin of only 226 c.c. At present it is only in an experimental stage, but if and when placed on the market the weight of the complete machine, we are told, should not be more than 85 lb.

### A.A. Badge behind the Firing Line.

A soldier, who in peace times is an Automobile Association patrol, recently brought to the A.A. headquarters a broken A.A. badge that he picked up behind the firing line in France. The badge showed marks of having been blown off a car by shell fire.

The twenty-five guinea silver challenge cup presented by *The Motor Cycle* to the Doncaster and District A.C. (M.C. Section), which was won at the Doncaster Speed Trials by S. R. Axford in 1914. The cup is 17½ in. in height, and weighs 3 lb. 6 ozs. Further shields will be added to the plinth, bearing the different winners' names.

### New Models in this Issue.

Among the 1916 model motor cycles described and illustrated in this issue are the—

- 2½ h.p. Bradbury medium weight.
- 6 h.p. Dunkley.
- Two-stroke Calthorpe.
- 7 h.p. Indian sporting Powerplus.
- Ixion lightweight sidecar outfit.
- G.K. sidecar attachment.

One or two of the above machines are entirely new productions, and have not hitherto been described in print.

The exclusive photographs in the centre double pages of Field Marshal Viscount French inspecting Motor Machine Gun Batteries are by our own photographer. Enlargements of these negatives are on exhibition at the Motor Machine Gun Training Centre.

### Auto Cycle Union Notes.

At a meeting of the General Committee, held on February 24th, matters of more than usual interest to our readers were discussed, as the following indicates:

The following resolution, being duly moved and seconded, was carried unanimously: "That, owing to circumstances caused by the war, the operation of rules 28, 29, 30, and 31, which provide for the annual reconstitution of the committee, shall this year be suspended, and that the present committee and officers shall remain in office for a further twelve months."

**ELECTION OF NEW MEMBERS.**—The Secretary submitted the names of nine candidates for election as town members, and twenty-one as country members, all of whom were afterwards duly elected.

Arising therefrom, it was unanimously agreed that in future a country member shall be held to be a member not having a residential or business address within twenty miles radius of Charing Cross, and that any existing rules or regulations to the contrary be accordingly amended to this effect.

**ANNUAL GENERAL MEETING.**—It was agreed that the annual general meeting should be held on Thursday, March 30th, at 6.30 p.m., at the Royal Automobile Club.

Business to be transacted at the annual general meeting will be: The election of a president and vice-presidents, the receipt of the annual report of the Union for the past year, the receipt of the balance-sheet of the Union for the past year, the consideration of any recommendations for the advancement of the sport and pastime of motor cycling. Such recommendations must be received by the Secretary not less than twenty-eight days before the meeting, and must be signed by at least twenty-five members.

### Pleasure Motoring and Local Taxation.

Inland Revenue licences are taken out in January, and before the end of the following month comes the recommendation that private motorists should lay up their cars and cycles. This is probably a mere coincidence, but many of the less affluent riders would be glad to know whether, in the event of their machines being put on one side, the tax would be returned to them.

### More Ford Stories.

The Ford yarns published in our issue of last week have aroused the greatest interest. The following two have been received since:

Why is a Ford like the first-born of a lady of means? Because it has a new rattle every day.

The Ford Co. issued a certain number of American cent tokens, some of these having on the one side the letters F.O.R.D. A new car was offered to the first person returning a complete set of these tokens to the Ford Co.'s head office. One man was successful, and made his application for the car. On arriving at the works he was requested to go into the showroom to pick out his car and then see the manager. After some little time he returned to the office, and on the manager asking if he had decided which one to have, he replied, "I think I'll have my four cents back, thanks."

### Empire Trade after the War.

Speaking in the Canadian House of Commons at Ottawa on February 17th Sir George Foster, Minister of Trade and Commerce, said that one of the most important lessons of the war was the need for the co-ordination and co-operation of all parts of the British Empire. The first thing that would take place after the war would be the revision of the treaties and tariffs which governed trade. The Allies would be disposed to unite their economic forces in order to protect their own peoples and the British Empire would get itself together.

### Another Despatch Rider Killed.

Cpl. H. E. Govett, of Rugby, a motor cyclist despatch rider in the Royal Engineers, who was killed in the Dardanelles on December 19th last, will be remembered by many of our readers, as he was a frequent attender of important motor cycle competitions, and usually occupied the seat of J. R. Haswell's sidecar when that rider set up his notable performances. Govett, too, was the passenger in the Singer light car when Ivan B. Hart-Davies set up the record of 34h. 39m. from John-o-Groat's to Land's End (equalling an average speed of 25.57 m.p.h.) during the last week of June, 1913. Govett was a member of the Coventry and Warwickshire Motor Club.

### Novel Non-stop Engine Run.

A Harley Davidson motor cycle with the rear wheel jacked up has run continuously in the showroom of a Phoenix U.S.A. dealer for eight days and twenty-two hours. During this time the machine, according to speedometer, covered 4,310½ miles.

### The Indian Again.

Following Baker's records in Victoria comes a cablegram from Melbourne stating that on February 21st Jack Booth, on a 7 h.p. Indian, broke the world's half-mile road record, the time being 18½s. This works out at an average speed of 95.74 m.p.h., and it should be noted that it was made over a level road with no wind. The highest speed ever accomplished on a motor cycle at Brooklands was that of just over 92 m.p.h., by S. George on an eight-valve Indian.

### A 2½ h.p. and Sidecar up Nailsworth.

The recent hill-climbing test up Nailsworth Ladder seems to have set the ball rolling. Not only has this notorious hill been climbed by a 3½ h.p. Sunbeam and sidecar, but we now understand that Mr. Jack Phillips, who will be remembered as a most successful competition rider of Douglas machines, has been successful at the fourth attempt in making an absolutely clean ascent with a 2½ h.p. Douglas and sidecar carrying a ten-stone passenger

MOTOR CYCLISTS, ATTACHED TO AN OVERSEAS DIVISION, WHO HAVE JUST COMPLETED THEIR TRAINING AT WITLEY CAMP.

- (1) Returning to camp after a hard day on the road. (2) The R.E. officer in charge of the motor cyclists, who uses a 10 h.p. Singer light car.  
(3) Going into the garage. (4) Outside the garage door.

## A NEW ZEALANDER FOR THE M.M.G.S.

A READER named Robert Lloyd, of Ngatimote, N.Z., recently made application to the Editor for enlistment in the Motor Machine Gun Service, and enclosed money order for £1 so that a cablegram might be sent to him. We have been glad to despatch a message accepting Lloyd, who has had seven years' experience, during which period he has owned fourteen different makes of machines.

## FORD YARNS FROM MALTA.

P.O. G. L. ROSSITER, of the R.N. Armoured Car Division, sends us two Ford stories. He writes from Malta as follows:

"In some extraordinary manner *The Motor Cycle* has reached me with persistent regularity during the past ten months, in France, Egypt, Lemnos and Imbros Isles, Suvla Bay, and now here in Malta, reducing the boredom of convalescence to a minimum. I see in the latest copy to hand you ask for Ford stories. Are the following new in England? Shortly after the outbreak of war the Germans found that their stock of Iron Crosses was far too large, and for economical reasons they decided to sell a quantity as scrap metal. Accordingly a large crate full of crosses was despatched to the Ford Co., who received it, but not with a letter of explanation. They replied as follows: 'Dear Sir,—This is the worst smash we have ever seen. A new car is being forwarded at once.'

"And this one: A motor cyclist came across a man seated by the roadside, and a Ford car on the top of a wall. He stopped and enquired what was the trouble. 'Well,' replied the motorist, 'I was trying to start the engine, when the car came off the handle and landed up there.'"

A. J. Palmer, late of the staff of Iliffe and Sons Ltd., has been promoted from second-lieutenant to lieutenant in the Motor Machine Gun Service.

Robert Lloyd, of Nelson, N.Z., the latest overseas candidate for service in the M.M.G.S.

## WITH THE SALONIKA FORCES.

WE are able to supplement the news of despatch riders with the Salonika Forces, published on page 74 of our last issue, with some further details that have come to hand in a letter from Cpl. John C. Coney. The photographs reproduced herewith, for which we are indebted to Coney, were taken during the advance into Serbia at the end of last year. Unfortunately, they do not show the appalling "roads" the despatch riders had to travel along, but from what Coney and other readers in that part of the world have told us, the roads behind the firing line in France must be as billiard tables compared with what our men have to contend with in Macedonia. Douglas and Triumph machines covered themselves with glory by standing up under such terrible conditions. Cpl. Coney believes there were only three riders who completed the return journey by road, and

they were mounted on Triumphs. Coney was one of the three, and he and his machine have seen ten months' continuous service. On the return journey to Salonika they had to entrain for a portion of the way owing to the heavy rains. Before this they had crossed successfully many rivers, but the worst bugbear of the "road" was the number of big boulders, which caused several broken crank cases. Coney and his comrades are now back at Salonika, where, excepting the numerous big pot-holes and broken metal, riding is not so bad.

## DESPATCH RIDERS IN EGYPT.

CPL. W. HULLAH, a despatch rider with the British Forces in Egypt, in the course of a letter we have received from him speaks very highly of the machines in his section. Although "road" conditions are totally different in Egypt from those existing in either France or Macedonia, yet in their own particular way the former provide ample testing of both riders and machine. Deep sand often has to be ridden through, but it does not stop his Triumph, and the handle-bar-controlled clutch is particularly appreciated.

## WIRELESS SIDECAR OUTFITS.

THE De Forest Radio Telephone and Telegraph Co., of New York, has now in operation a number of Indian sidecarriers which are fitted up as travelling wireless stations. The machines go in pairs—one carries the wireless outfit and the other serves to carry poles, wires, tent and blankets, and other paraphernalia for camping. Thus each group of the service is independent of tall trees and houses, on which the field wireless formerly relied for temporary quarters. In one compartment of the wireless carrier is located a 5 h.p. twin-cylinder Indian engine for driving the electric generator. The outfits are finished in the U.S.A. Army olive drab. With the British forces field wireless outfits are carried on the backs of horses, the power to drive the generator being supplied by Douglas engines.

Despatch Riders Postill, Coney, and Robinson leaving the camp.

SOME DESPATCH RIDERS WITH THE SALONIKA FORCES.

Taken "up country" in December, 1915, the three men shown, riders

of Triumphs, are supposed to have been the only ones to ride their machines back to Salonika.

Cpl. John C. Coney and his Triumph after ten months continuous service. Observe handle-bars.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

### Patents.

Sir,—There are two patent notices in your issue 672, February 10th, which are closely related, both ideas having been used by the same firm previously.

I refer to Nos. 1,359 and 5,064.

No. 1,359 is almost identical to the old Rexette gear of 1905-6, designed by Fred Barnes (now of Zenith fame), and manufactured by the Rex Motor Co., Ltd., the principal difference being that the two-speed gear wheels are omitted in this new design.

The engine lubrication No. 5,064 is an adaptation of my design, which was adopted by the Rex Motor Co., Ltd., for their 1914 engines. I used and proved its success on the road during the latter part of 1913. I also adapted the idea to a two-stroke during 1914 for the same company.

It is strange, though nevertheless a fact, that two motor cycle manufacturing companies have taken out patents for this same idea since I introduced it in 1913.

H. SARGINSON.

### Pleasure Motoring.

Sir,—I have just been reading your article in regard to the National Organising Committee for War Savings, and felt I must write and ease my mind on the subject, as I feel very keenly about it. To begin with, my husband is fifty-two years of age, is a colliery blacksmith, and works six days a week, every Sunday morning, and sometimes all day. I am forty-six. We have been married eighteen years, have furnished and bought the house we live in, kept my husband's mother nine years until she died, and are the owners of a 4 h.p. combination, besides a nice nest egg in hand for a rainy day, also a goodly sum on Exchequer Bonds, to which I shall add whenever I can, and like the village blacksmith, we can—

"Look the whole world in the face  
For we owe not any man."

Before we got our machine we had push cycles, but I fell into ill health and had to give it up; but my doctor said I must have plenty of fresh air on account of bronchial asthma and heart trouble, and so we got the machine for that purpose.

Now, sir, do you think there is anybody that can honestly say we are riding for pleasure. No, sir; the Committee ought to go into some of the homes I see and get to know about the waste and extravagance among the working classes, for I know some who go to two picture halls in a night, besides riding in a 'bus to go there and back; and that is not the only thing. Now, in the eighteen years we have been married we have been twice to a picture hall and five times to a theatre. We like to put our money in something we can see, but not to be deprived of a health-giving run at the week-end whenever work allows us to do so.

J2595.

Sir,—I think my case may be of some interest, in view of the discussion on this subject.

I joined the Special Reserve as a subaltern within a week of the outbreak of war. After months of hard work in a remote part of this country I was sent abroad. I took part in the Battle of Ypres in April and May, and was eventually very seriously wounded in October.

I am now on sick leave, and shall be for several months. Afterwards I shall probably spend several months in England on light duty and home service before being fit to go abroad

again. While serving I had saved a certain sum from my pay; I had no other means; this has been added to a "wound gratuity."

I have therefore contributed over £100 to the War Loan, and with the remainder bought a 1916 4 h.p. machine—one turned out by a certain firm in excess of the requirements of our own and allied Governments.

I am undergoing daily medical treatment, but I wish to ride my cycle in the afternoons for pleasure—though, inasmuch as this will give me much fresh air, it will also help to cure me more quickly.

My maximum expenditure in petrol is not likely to be more than 7s. 6d. a week, of which nearly 3s. goes to the revenue.

Surely neither this expenditure nor the actual buying of the machine can be condemned as very unpatriotic? At the same time I am debating whether my further savings, if any, should go to purchasing a sidecar to take out wounded friends and Tommies or to the War Loan.

I feel sure that there must be many of your readers in the same position as myself, and I trust that they will not be condemned by the somewhat merciless critics of the present day.

SUBALTERN.

### Forced Induction.

Sir,—I am submitting to you a sketch illustrating an idea for utilising the vaporised oil from the crank case release. I do not recollect seeing in your paper an idea of this

description, and I thought it might prove of interest to some of your readers.

In my opinion, it has the following advantages: It gives a forced induction, a better mixture than pure air, also assists in lubrication.

C. LINZELL.

B.E.F.

[The idea is not new; a similar contrivance was first used many years ago on Rex machines.—Ed.]

### Two-stroke Design.

Sir,—In reply to several correspondents who have adversely criticised my figures, may I be allowed to state that I did not in any way intend the figures 6–26 m.p.h. to represent the extreme limits of power of the Levis? I only used those figures to denote the speeds I usually travel at. A well-tuned Levis will run from 4 to 40 m.p.h. without four-stroking, but of course one could not expect to keep up the latter speed on a long journey.

I should also like to say that my experience of lightweight machines—including the Motosacoche—leads me entirely to

disagree with Mr. De Lissa in your issue of February 17th as to the superiority of the four-stroke in reliability. My present two-stroke is well on its third year without a single engine repair or stoppage on the road.

Thirdly, Mr. Martin has not had experience of the "Baby," or he would not put the weight at 140 lb.—90 lb. would be nearer (February 10th, 1916). ROLYAT.

Sir,—We note Mr. J. Martin finds the facts regarding the illusory nature of the two-stroke disease he sets out to cure unanswerable. That being so, it seems scarcely worth while worrying about the remedy, and he really must be joking when he suggests that forethought on *our* part can prevent petrol going stale in *his* crank case. As to the relation between compression and efficiency, he need only turn to any book on thermodynamics. The maximum possible efficiency of an internal combustion engine, and the standard by which actual performances are judged, is

$$1 - \left(\frac{1}{r}\right)^{\gamma-1} \quad \text{where } \gamma \text{ is } \frac{\text{Specific heat at constant pressure}}{\text{Specific heat at constant volume}}$$

and  $r$  is the compression ratio. Thus, when this increases, the possible efficiency increases also (the practical limitations on *exceptionally* high compressions are not the points at issue).

We should be the last to claim that release-valves, when driving, are more than a convenience, enabling the rider to slacken speed and afterwards get quick acceleration. Mechanical ones, however complicated, will have just the same limitations, and it is not a practicable proposition to abolish the throttle.

BIRMINGHAM LIGHT MACHINE CO.  
H. R. HUGHES.

#### Paraffin as a Fuel.

Sir,—I have read the article on the above by Mr. D. R. Edwardes-Ker, and am enclosing you a rough photograph of an ingenious idea for running on paraffin. The small tank under the saddle holds the petrol, and the usual petrol tank contains the paraffin. The carburettor nearest the engine is connected up to the paraffin tank and the back one to the petrol tank. The petrol carburettor has an air lever only, while the paraffin one has the usual two levers. The paraffin jet is rather larger than the usual petrol jet, and is fitted with a coil of thin wire over the top (to break up the paraffin as sucked through the jet). To start up the petrol tap is turned on and both the front carburettor levers are opened, and the back lever (air) is closed. As soon as the engine is running the paraffin tap is turned on and petrol off, back air lever opened, and front carburettor used in the usual way. Mr. G. H. B. Clarke, of Broughton, Hants., has to be credited with this idea. He has used this two-carburettor system on his B.S.A. for well over 1,000 miles now with good result. We have recently taken the engine down, and found it to be in splendid order.

H. S. WALLIS.

Location of two carburettors for running on paraffin. See letter on this page from Mr H. S. Wallis.

A Scottish snowdrift. See letter on this page from Mr. C. J. Anderson.

#### Sidecarring under Wintry Conditions.

Sir,—Enclosed is a picture taken on the road between Balmoral Castle and Braemar, and locally known as "The Street of Monaltrie." In places the drifts are quite five feet deep, as shown in the photograph. In the distance is the steep ascent across to Donside, which may be familiar to many of your readers. The machine is a Triumph sidecar outfit. C. J. ANDERSON.

#### Spring Frame Design.

Sir,—It is quite a relief to me to know that the correct principles of design of spring frames are understood.

The very lucid article you published in your issue of February 3rd expresses very ably the sentiments that have been "rising half-formed in my breast" ever since the hundred and one brain waves on this subject first began appearing in your columns.

I have absolutely nothing to disagree with in the article, and would like to say I consider the strains described in fig. 2 by far the most serious—and in most, if not all, systems now on the market, no means are provided to counteract these strains adequately.

Another thing I think it is important to arrange for is this: that the amplitude of movement of the rear wheel should be as nearly as possible equal to that of the front wheel, otherwise the machine will feel as if it were rotating bodily in the fore and aft vertical plane about the front wheel (if the amplitude of springing of the rear wheel is greater than that of the front). I have found this fact out from actual experiments. C.W.P.

#### Foot Operation for Change Speed Gear.

Sir,—As regards the article in *The Motor Cycle* of February 10th showing an alteration to our change-speed lever, we may say that if the sketch is drawn from the actual article some considerable alteration must have been carried out to the small levers, which we think hardly possible under war conditions. If the alterations have not been carried out, the gear movement will not be correct, and full engagement will not be obtained in the middle gear.

If the long lever only is bent edgewise without disturbing the quadrant a very satisfactory gear change is assured, such as we think is hardly possible with any other type of gear. As a matter of fact, the writer personally often changes gear either with his knee or his foot with the lever in the orthodox position, and fully intends experimenting with a more horizontal type of lever to get the same result as that achieved by the originators of the sketch shown in your article. STURMEY-ARCHER GEARS, LTD.

## Tuning and Adjustment of Two-strokes.

**A**LTHOUGH the small single-cylinder two-stroke engine is so simple it is this very simplicity which gave rise to the various controversies as to the methods of tuning and adjustment to obtain the best results. Naturally, the different designs of engines have different peculiarities, and the makers of the engines should know best the methods most suitable for their own particular machine. We were, therefore, interested in a booklet, issued by the Villiers Engineering Co., Wolverhampton, entitled "How to Use and Adjust the Villiers Two-stroke Engine."

This make of engine is found on many two-stroke machines, and, in addition, the book contains much information which would be equally useful to owners of other makes. For these reasons we consider that the following extracts will be of general interest:

### Carburettor Jets.

It is difficult to make any hard and fast rule as to the size of jet; a general mistake, however, appears to be to use too large a one. Always use the smallest jet that will give regular running. This will keep the engine cool and save petrol.

As a general rule a No. 28 jet will be found the best, but for special conditions other jets may be required.

### Carburettor Adjustment.

See that the carburettor is fixed in a vertical position, otherwise the petrol level will not be correct. The float chamber should be in front of the jet.

Cables must be adjusted after the carburettor is fitted to the motor cycle as a bend or two in the cable alters the adjustment.

Put carburettor levers in the closed position, and then adjust until all slackness in the cable is taken up.

All sharp bends in the cable must be avoided; otherwise the inner cable will work stiff.

See that the connection between the carburettor and the cylinder is absolutely air-tight so as to ensure satisfactory running at low speeds.

### Misfiring.

This is usually caused through dirt in the gauze of the carburettor below the float chamber, or faulty ignition.

### Uneven Firing.

This is nearly always due to carburation. Only experience will teach the rider the best position for his levers. A special instruction booklet is supplied with each different make of carburettor.

### To Start.

Fill oil compartment in tank with good motor cycle oil, such as Price's

Huile de Luxe, or Wakefield's summer grade.

Fill petrol tank, using a funnel fitted with fine wire gauze to prevent any water or dirt getting into the tank.

Open throttle lever half-way and keep air or top lever closed.

Advance ignition slightly and hold up compression release lever.

Flood carburettor, push machine along a few yards, then suddenly drop compression lever, and the engine will start.

Immediately engine is started, release oil plunger and unscrew regulator to sight feed, so as to allow the oil to run freely.

When engine begins to smoke, screw down regulator until the oil spots about 36 drops per minute.

The exhaust gases should give out of the silencers a slight blue vapour.

When climbing hills use more oil by unscrewing the oil regulator.

Just before stopping engine turn off oil, or it will flood the carburettor and cause difficulty when restarting.

When machine is not in use be sure and turn off petrol tap.

Be sure and see the oil is flowing when the machine is running.

When the machine is new use plenty of oil.

### To Remove Flywheel.

If at any time the flywheel has to be removed, care must be exercised in replacing it.

### OVERSEAS MOTOR CYCLIST ON SERVICE.

Cpl. Maker, R.E., is another keen motor cyclist who came from overseas to serve his native country. He was resident in Calcutta at the outbreak of war, being a member of the local motor cycle club, and is now despatch riding on a Triumph in France.

See that the taper in the shaft and the hole in the flywheel are perfectly clean.

That there is no dirt in the keyway, which will project the key up above its proper height.

That the key binds only on the sides, and never on the top.

Then screw the locking nut up as tightly as possible.

After, with a piece of brass or lead, jar the flywheel up the taper and follow up by further screwing up the nut.

### Exhaust Box.

Always see that the exhaust gases are coming out of the tail pipe from the silencers.

### Adjusting Magneto Chain.

Should this chain stretch there will be a rattle in the aluminium case, and the magneto will fire irregularly. To adjust—

Remove front of aluminium chain cover. Unscrew the bolts that fasten the magneto base plates to the front engine plates on both sides.

Push the magneto forward until the chain is properly adjusted, and then screw up bolts.

### Timing of Magneto.

With the magneto fully retarded the contact points should break exactly on the top centre. To find top centre take out sparking plug, insert small piece of wire and turn engine round slowly until you feel the piston reach the top of the stroke. Hold engine and magneto firmly in these positions and tighten magneto chain wheel on taper by screwing up set screw (right-hand thread).

### Release Valve Lever at the Top of Cylinder\*

The Bowden cable needs to be carefully adjusted so that it gives the full motion for both opening and closing.

### To Remake Joints.

Clean off old seccotine from the surface of the joints with hot water. Cut brown paper the pattern of the machined surface of the joint. Coat each side of the paper cutting with seccotine. Place between the joint to be made and screw the nuts up tightly. Leave fifteen minutes to set and then trim off edges.

### What not to do.

Don't take the engine to pieces for the fun of the thing. More engines are spoilt by tampering with them than by regular running. Only proper motor cycle mechanics should take this engine apart.

Don't under any circumstances take the crankshaft apart. If there is anything wrong with that it should be returned to the makers, who have special facilities for dealing with it.

A selection of questions of general interest received from readers and the replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" on the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### Some General Queries.

? (1.) What is wrong with the plug when it sparks between the insulator and the body instead of at the points; can this be cured? (2.) Should the four holes which are drilled in the balance weights of the crank (engine with outside flywheel) be all filled with lead, as only three of mine are filled, one of these being slack? I was thinking the other one might have worked out. Which is the more suitable, lead or white metal, for filling them up? (3.) Would you advise me when coasting down hills to use free engine? (4.) Should the exhaust or the inlet valve spring be the stronger on a 2 h.p. four-stroke? The inlet valve stem is badly worn. How can I prevent this wearing. The valve seat is worn oval owing to the valve always going to one side while lifting. How can I true up this? (5.) My machine is fitted with a pump lubrication. There is no tap on the pipe to the crank case. Is the oil liable to run down into the crank case while it is standing? (6.) What is the best position in which to set a fixed ignition magneto?—R.P.

(1.) The reason that the plug sparks between the electrode and the body instead of between the points is that a short circuit is taking place. This may only be due to too much oil, in which case thoroughly washing the plug in petrol will cure it. On the other hand, it may be due to a faulty insulator, when the only cure is a new plug. (2.) It is usual when the balance weights are filled to fill all the holes drilled; but in this case the one hole may be left empty to secure the correct balance. A special lead alloy is usually used. (3.) No; it is not advisable to use neutral position for coasting down hills, as it is difficult to engage the gear again, and is liable to damage the dogs. (4.) The exhaust valve spring should be stronger than the inlet. We do not know of any cure for the valve stem wearing. You will have to get the seating trued up by a special tool made for the purpose. We would advise you to take the seating to a reliable firm of engineers. (5.) The pump is probably fitted with a ball valve to prevent the oil flowing into the crank case when the machine is standing. So long as this valve is in order you will have no trouble from this source. (6.) It is best to have a variable ignition if possible, but if fixed ignition is fitted have it as far advanced as the engine will take it without knocking. It is impossible to give any definite position for this, as every engine will vary to some extent.

### Cubic Capacity.

? I am somewhat puzzled how to find the capacity of an internal combustion engine cylinder as specified by the makers, and would be very much obliged if you could enlighten me on the following questions: (1.) Does c.c. mean the whole of the space in the cylinder, including the combustion chamber, as obtains when the piston is at the bottom of its stroke, or only the amount of space displaced by the piston in working? (2.) If the whole of the space is meant, how is that in the combustion chamber calculated when it contains irregularly-shaped pockets, as in a side-by-side valve engine? (3.) Would it be feasible to find the c.c. by filling the cylinder up to the correct point with water and then transferring to another vessel of regular shape in which it could be measured? (4.) What is the usual amount of space allowed for the combustion chamber, in proportion to the whole of the cylinder space?—W.H.

(1.) C.c. means the outswept volume of the piston only, and does not include the combustion space. (2.) This space is not included. (3.) No, this would not give you the c.c. It can be obtained from the following formula:

$$D^2 \times S \times N \times .7854.$$

D = Bore.

S = Stroke.

N = Number of cylinders.

(4.) This depends entirely upon the particular design of engine, and the compression ratio decided on, which on most engines is roughly 4 to 1. Thus in a 500 c.c. engine the compression space will equal 500 divided by 3.

### Long or Short Wheelbase and Skidding.

? Would you kindly inform me on the following points? Assuming that two machines are identical in every respect (viz., gears, horse-power, even torque, distribution of weight, tyres and wheels, etc.), but that one has a longer wheelbase than the other, also one is heavier than the other, which machine would be the more liable to skid on greasy roads, the shorter or the longer wheelbase, the lighter or the heavier model?—A.G.M.

We think the general distribution of the weight affects skidding more than the actual length of the machines. Either a very long machine or a very short one will be almost equally liable to skid, although in all probability the shorter one would be more easily corrected, but the longer one would not be as likely to skid in the first instance. The light machine would probably skid more readily than a heavy one, but when once a skid has commenced, there is no doubt it is more easily rectified on a light machine than on a heavy one. The weight of both machine and rider should be distributed as nearly as possible equally

upon the two wheels in order to overcome to the greatest extent the tendency to skid. If all the weight is at the back, or all in front, it will tend to cause undue skidding. The liability to skid on the various types of machines depends to a very great extent on the type of road surface; for instance, a very rutty road would undoubtedly affect a light machine to a greater extent than a heavy one, while a steep, greasy, highly-cambered road would possibly, under certain circumstances, cause a heavy one to skid more readily.

Miss Dorothy Hazlewood, mounted on her 5-6 h.p. Hazlewood combination. The photograph was taken during a visit to Edge Hills. Miss Hazlewood is the daughter of Mr. James Hazlewood, a director of the firm producing the motor cycle of that name.

**Overheating.**

(1.) I have a 5 h.p. twin Rex, a.o.i.v. It runs well for four or five miles, but then seems to overheat, and will not run well again until cool. I am using single-point plugs; B. and B. carburettor with 32 jet; timing appears to be correct. Could you tell me the likely cause of this trouble? (2.) How many miles do you recommend me to run per pump of oil?—F.L.

(1.) The probable cause of overheating may be due to any of the following points: (a.) Too rich a mixture. Try a slightly smaller jet. (b.) Inlet springs too weak, and allowing too great an opening. Try fitting washers on valve stem to reduce valve opening to about  $\frac{3}{32}$  in. (c.) Insufficient lift on exhaust valves, owing either to too great a clearance between tappet and valve, or owing to the cam having worn. (d.) A choked silencer outlet. (e.) Insufficient lubrication. (f.) Incorrect timing. Exhaust valves should not close before piston reaches top of exhaust stroke. (2.) It will usually be found that half a pumpful of oil every four miles will be about correct.

**Misfiring at Speed.**

I have an old  $2\frac{1}{2}$  h.p. single-cylinder, with automatic inlet valve, Hellesen ignition, and B. and B. carburettor. It starts fairly easily with the spark occurring dead on the top of the stroke, and it runs all right, though not very fast. As soon as I advance the spark at all, however, the machine will gather speed for about ten yards and then misfire for a few strokes till it has slowed down a bit. Then it will fire regularly again for another ten yards and so on. In addition it will not climb any hill at all steep. No. 30 jet is fitted, and I cannot give much air, but with No. 32 jet it overheats badly and stops every two or three miles, and I have to wait till it cools down. The piston and rings are a good fit, and the cylinder is perfectly true, tested by micrometer. I have fitted a new exhaust valve, and the inlet valve fits its seat quite truly.—A.B.

We should think your trouble is due to a faulty contact breaker. With accumulator or battery ignition this is nearly always an unreliable point. You should make sure the spring which separates the points is quite strong, and that the points meet quite truly, and are made of either pure platinum or one of the special metals sold for this purpose. You ought to be able to give a certain amount of air after the engine has once started. Possibly the cause of overheating when a larger jet is fitted is insufficient lift of the exhaust valve, or a choked silencer. Too great a lift on the automatic inlet valve will also cause overheating, in which case the lift should be reduced by fitting washers under the spring cap till the valve only opens  $\frac{3}{32}$  in.

**Brakes Legally Required**

I have just purchased a four-cylinder F.N. motor cycle. It is fitted with an expanding brake on the back wheel; it has no front brake, and the seller assures me that it is absolutely unnecessary owing to the strength of the back one. I am under the impression that it is necessary by law to have two brakes, one back and one front.—G.N.M.

It is legally necessary in this country to have two independent brakes on a motor cycle, but it is not necessary that these should be fitted one to each wheel. They are often fitted both on the rear wheel, but the fact of one brake being very powerful does not, as the seller tells you, free you from the obligation of fitting a second brake.

**Sluggish Running.**

I have an old Quadrant motor,  $3\frac{1}{2}$  h.p., with valves side by side, magneto ignition. The exhaust valve is lifted by a sliding T-piece, but the inlet valve is sucked open. The T-piece does not touch the inlet valve, nor was it, apparently intended to do so, as there are no timing wheels for the purpose. When I bought this machine some six months ago it went well, but a friend of mine ran into a post with it and broke the forks; so I took the engine out and, while the frame was being repaired, fitted a set of new piston rings; otherwise, except grinding in valves, I did not interfere with engine. I can start the machine up, and it runs slowly for about a minute, and then it stops. It will not speed up, no matter what is done with the levers, and will not take air. Carburettor (B. and B.) is in good order, and clean; compression good. Exhaust valve lifts about  $\frac{1}{16}$  in. Inlet will open as much as  $\frac{1}{16}$  in. when lifted by hand. Exhaust valve closes when piston is on top dead centre. Would keeping machine in damp shed cause this trouble?—BUCK.

As there is no cam or provision for a second tappet, your valve is evidently intended to be worked automatically, though it is very unusual to fit a.o.i. valves side by side. The inlet is usually fitted above the exhaust. We should think the reason for your machine refusing to start or run is that there is an air leak somewhere between the engine and carburettor. You should bind all doubtful parts with adhesive tape. If the machine has been kept in the damp, you should make sure the contact breaker bell crank is free in its bearing, as the fibre bush sometimes swells with the damp and causes trouble. The fact that your machine will not take any extra air points to carburettor trouble and too weak a mixture. A magneto will never spark so well when retarded as when fully advanced. This is due to the fact that

the armature is arranged to be just breaking the fields while the contact breaker points are separating with the ignition fully advanced, and in this setting the hottest spark is obtained. Your timing appears to be about right.

**Loss of Power.**

I have lately acquired a  $3\frac{1}{2}$  h.p. Triumph, and during the last week it has lost power considerably. The compression is fair, and the belt sufficiently taut. The engine was cleaned out only a short time ago, and the plug is quite clean. When I had it first, about three weeks ago, I could take any hill around here (Bournemouth) with ease on top. I now find a great difficulty in getting it up some on bottom. The machine is a last year's model, and is otherwise in fine running order.—G.E.T.

The cause of your machine falling off in power may be due to many things. The most common are: Partially choked jet or carburettor passages, dirty engine, piston rings gummed up with carbon deposit, valve springs too weak, too great a clearance between the tappets and the valves, or choked silencer causing back pressure. Be sure to give sufficient oil.

**EXPERIENCES WANTED.**

"L.G.R." (Narberth).—Grado multi pulley for use on Triumph.

"J.A.S.W." (Parkhill).—7.9 h.p. 1915 Harley-Davidson. Reliability, efficiency, and speed.

"R.M.C." (Stirling).— $4\frac{1}{2}$  h.p. B.S.A. models K and H. Consumption, reliability and efficiency.

"J.S." (Leeds).—1912 P. and M. Also Auto-wheel. Reliability, consumption, and speed.

"L.M.R." (London).— $2\frac{1}{2}$  h.p. Clyno two-speed. Speed, consumption, flexibility, and durability.

"L.W." (Manchester).—Norton big 4 h.p. combination. Reliability, consumption, power, and ease of control in traffic.

"E.M." (Aldershot).—T.T. Norton or T.T. Drough with Philipson pulley and sporting sidecar. Hill-climbing (22 stone up) and consumption.

**RECOMMENDED ROUTES.**

**BRISTOL TO GRANTHAM.—E.M.**

Bristol, Gloucester, Cheltenham, Teddington, Broadway, Weston-sub-Edge, Stratford-on-Avon, Warwick, Leamington, Rugby, Lutterworth, Leicester, Melton Mowbray, Waltham, Grantham.

**LEICESTER TO CHICHESTER.—G.P.**

Leicester, Lutterworth, Rugby, Dunchurch, Southam, Banbury, Deddington, Oxford, Wallingford, Pangbourne, Bath Road, Aldermaston, Basingstoke, Alton, Petersfield, Harting, Chichester.

**PUBLISHERS' ANNOUNCEMENT.—THE RESTRICTED SUPPLY OF PAPER.**

In view of the decision of the Government to limit the import of material for the manufacture of paper it is imperative that every possible step should be taken to avoid waste of paper in any form. It has been the custom in the past for newsagents to order a certain number of papers for chance sales, and these copies if unsold become what are known as "returns"; in other words, waste copies.

In the case of "THE MOTOR CYCLE" the percentage of returned unsold copies has been remarkably low, but in order to conserve the supply of paper in future it is desirable that the waste of copies, ordered to accommodate occasional purchasers, shall as far as possible be eliminated.

Readers of "THE MOTOR CYCLE" are urgently requested to assist in this matter by always buying their copies from the same place, if possible, or by giving a definite order to a newsagent for the regular supply of the journal each week.

## Average Prices OF Second-hand Machines.

**W**E give below the average prices of second-hand models offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model the average for the past week is quoted, otherwise the last average is given.

### The Tinol Soldering Outfits.

In our issue of February 17th "Road Rider" gave his experiences of the Tinol soldering outfit. The makers, Bi-Metals, Ltd., of 57, Lant Street, Southwark, S.E., point out that during the war they are unable to supply the small self-blowing lamp. The latter has been replaced with a brass mouth blow lamp, which is, it is stated, as effective, but not so convenient.

### The Wounded Soldiers' Outing.

The Harley-Davidson Motor Co., Ltd., who organised the sidecar outing for wounded soldiers reported in our last issue, has received a letter of appreciation from the Civil Administrator of the City of London Red Cross Hospital, Finsbury Square. In this it is stated that the men enjoyed themselves immensely, and the ride has done them all good.

### Review.

"The Largest Motor Cycle Business in the World." This is published by the Hendee Mfg. Company, and is a history of the Indian motor cycle from the days of its origin to the present time. It is a remarkably fine production, well illustrated and in no manner of ways a catalogue. The first Indian machine was finished in May, 1901, and it is a quaint-looking "beast" compared with the Powerplus of 1916. The cradle spring frame was first marketed in 1913—after eighteen months' testing—and its success is now well known.

### War Time Economy.

A motor cyclist, who had a frugal mind, purchased a John Bull belt, which had seen much service, from a friend. It was originally a 3-in. belt, but was worn down to 2-in., the core being exposed on one side. This belt is still running with the whole core exposed, but it is doing good service, and has never pulled away from the fastener, nor has it been shortened except by the removal of the spare link. The rubber which came off the bottom was very tough.

### To Protect Belt Ends.

A correspondent, Mr. J. Boston, sends us a sketch showing how he protects his belt by inserting leather blocks between the belt ends and the fastener. He says that he finds this device most useful on

J. Boston's belt end protectors.

a Rudge-Multi or other variably-gear machine. The sketch is self-explanatory, but it should be noted that the leather pieces are the same width as the belt, though they project slightly at the top and bottom.

### The Spur Sidecar.

The light sidecar referred to on page 80 of the Accessory and Sidecar Number of January 27th as the Spider is in reality known as the Spur. It is specially made for use with inexpensive light-weights, and is sold by Messrs. Grose, Ltd., 4, Old Jewry, E.C.

### The Institution of Automobile Engineers.

The next meeting of the Institution of Automobile Engineers will be held on March 8th, at the Royal Society of Arts, John Street, Adelphi, W.C., at 8 p.m., when Mr. J. Lawrence Hodgson, B.Sc., A.M.Inst.C.E., will read a paper entitled "The Fan Dynamometer."

### A New Appointment.

The sale managership of the motor cycle tyre department of Wood-Milne, Ltd., is now occupied by Mr. C. E. Kettle, until recently manager of the Liverpool Colmore Depot. In addition to his trade associations, Mr. Kettle is well-known in the North Midlands and the North by reason of his active connection with the Manchester and Liverpool clubs and the North-Western A.A.

### Catalogues Received.

"Forward Motor Accessories for 1916-17" is, as its name implies, a list of the sparking plugs, belt fasteners, and other articles made by the Forward Motor Co., of Summer Row, Birmingham.

Henderson sidecars for 1916 are well illustrated and described in a new catalogue we have received from the makers, whose works are at Cecil Square, Sheffield. There is a complete range of cane and coachwork bodies, sporting and double-seaters, etc.

We have received from Messrs. H. Taylor and Co., Ltd., 21a, Store Street, Tottenham Court Road, W.C., a tyre and driving belt list, which this firm will be happy to send to any reader on application. All the best-known makes of tyres are listed.

"Correct Lubrication." The Vacuum Oil Co., Ltd., Caxton House, Westminster, S.W. A useful publication, giving some valuable hints concerning the lubrication of motor vehicles, together with the prices of the various Vacuum oils and greases. Not the least interesting part of the booklet, from our point of view, is a list of motor cycles at the end, giving the qualities of oil recommended for each make and type.

J. Harrison and Sons, Ltd., 49-51, Constitution Hill, Birmingham. In this are listed various patterns of Britannic sidecars and coachbuilt sidecar bodies.

In last week's issue of *The Motor Cycle* we inadvertently gave the wrong address of Messrs. Bowden Wire, Ltd. This should be Victoria Road, Willesden, N.W.

## MOTOR CYCLES FOR SALE.

## Auto-Wheels.

- UTO-WHEEL**, very good, complete; £7/10.—Varcoe, Park View, St. Austell, Cornwall. [X3600]

# The Road— Shock Problem

At the present time—with the majority of town and country roads badly cut-up by the continuous war-time traffic—it is more than ever an imperative condition to the Motor Cycle Buyer that he should equip his mount with a thoroughly efficient and dependable Spring Fork, to effectively cope with every trouble arising from the roads' unevenness.

The DRUID  
MARK II.  
Made in three  
models—for  
Solo or Sidecar

Experience has proved the merits and demerits of many makes of Forks, and demonstrated, too, the exceptional efficiency and all-round marked superiority of the now famous

## DRUID MARK II.

—the ONLY Spring Fork which totally absorbs every class of shock, both Vertical and Horizontal, and more—absorbs them actually WITHIN ITSELF, ensuring continuous comfort to the rider.

Write us for full DRUID information and then—INSIST upon the DRUID.

7 1/2 h.p. Indian, T.T., clutch, good tyres, fine machine, exceptionally fast; £30, or exchange lower power.—C. Pritchett, 141, Merton Rd., Wimbledon. [1776]

1915 7 1/2 h.p. 3-speed Indian and sidecar, property of an officer on active service; sacrifice for quick sale £55.—C/O Wilkin, Hunter's Bar, Sheffield. [1824]

## THE DEPENDABLE FIRM.

The SERVICE Co., Ltd.

We can deliver any of the following 1916 machines from stock immediately, and upon the following advantageous terms:

A BROUGH for . . . . .	£12 0 0
And 12 Payments of . . . . .	£4 2 10
A COVENTRY EAGLE 2-stroke for . . . . .	£7 5 0
And 12 Payments of . . . . .	£2 10 6
A CONNAUGHT 2-stroke for . . . . .	£5 17 6
And 12 Payments of . . . . .	£2 0 3
An O.K. JUNIOR 2-speed with J.A.P. engine for . . . . .	£7 10 0
And 12 Payments of . . . . .	£2 10 10
An ENFIELD Comb'n 6 h.p. for . . . . .	£19 7 0
And 12 Payments of . . . . .	£6 2 6
A JAMES Comb'n 4 1/2 h.p. 3-sp. for . . . . .	£16 15 0
And 12 Payments of . . . . .	£5 12 0
An AMERICAN EXCELSIOR 7-9 h.p., 3 speeds, for . . . . .	£14 0 0
And 12 Payments of . . . . .	£4 18 0

We also have in stock NEW IMPERIAL, B.S.A., IVY, INDIAN, ZENITH, A.J.S., SUN, NORTON, etc., which can be purchased on similar terms.

A LIBERAL ALLOWANCE CAN BE MADE ON YOUR PRESENT MACHINE AND TAKEN AS A DEPOSIT.

YOUR ENQUIRY WILL BE ESTEEMED AND RECEIVE OUR IMMEDIATE AND CAREFUL ATTENTION.

## SECOND-HAND MOTOR CYCLES.

We have a good stock of these, and overhaul and test every machine before sending out. Selection is given below, but we should be glad if you will kindly write for full lists, which will be sent per return, post free.

RADCO, late 1915, 2-stroke, 2-speed, with lamp and horn . . . . .	£25 0
CONNAUGHT, 1914, 2 1/2 h.p., 2-speed, with lamps and horn . . . . .	£26 0
ALLON, 1915, 2-speed . . . . .	£32 10
P. & M. Combination, 1914, with luggage grid, lamps, horn, plenty of spares . . . . .	£55 0
CLYNO Combination, 1914, 3 speeds, with No. 6 Sidecar, hood and screen, lamps . . . . .	£67 10
TRIUMPH, 1913, 3-sp. gear, lamp and horn, with side-entrance Sidecar . . . . .	£40 0
O.K.-PRECISION, 2 1/2 h.p., magneto, spring forks, etc., 1913 machine, nice order . . . . .	£16 0
RUDGE, 3 1/2 h.p., 1911, with 2-speed gear and free engine . . . . .	£22 10
TRIUMPH, 1912, clutch model, nice order . . . . .	£28 0
LEVIS Popular, 1915, with lamps, horn, knee grips, etc. . . . .	£24 0
JAMES Combination, 1914-15, 4 1/2 h.p., 3 speeds, and accessories . . . . .	£52 10

ANY OF THE ABOVE can be purchased by Extended Payments, one-fifth deposit, and the Balance in 12 equal monthly instalments.

## The Outlook.

**T**HE unexpected is always happening. The truth of this adage has been proved many times over during the past eighteen months by prophets who have attempted to foretell the future. The nation is undergoing a strenuous time, and compulsory service has been partially adopted. Owing to her isolated position, Great Britain has been able to do without this and other institutions which have held sway on the Continent for generations. It is useless to hide the fact that the adoption of compulsory service has had its effect upon the industry of late, but still the demand for motor cycles is brisk—thanks to the large following of wearers of khaki and Navy blue who form a goodly percentage of present-day motor cyclists. It is thought in more than one quarter that the Compulsory Service Bill will create a slump in second-hand prices on account of the number of machines which may now be offered for sale. No doubt there is a good deal in this contention, but we are of the opinion that prices will not be seriously affected, as the advent of spring, which is now at hand, will have a counterbalancing effect. At any rate, prices have not yet shown much downward tendency, and we know of a firm which, realising the shortage of new machines last year, is buying up all the modern motor cycles upon which it can lay its hands. After all, it is frequently overlooked that there are thousands of devotees of the motor cycle among men over military age. (The number of family sidecars to be seen on our roads is partial proof of this.) This section, together with the military aforementioned and an ever-increasing number of lady motor cyclists, added to which we have hundreds of youths whose parents, maybe, have purchased machines for them as an education in mechanics, and sometimes with a view to interesting them in engineering, provide the existing demand for new and second-hand machines.

Again, the motor cycle is no longer simply a luxury, and both it and the motor car have in most cases become a necessity and a part of our daily life. That we cannot do without them is more than ever the case, owing to the universal reduction in train services throughout the country.

It is undoubtedly a fact that officers and men quartered in out-of-the-way parts of the United Kingdom find that without a motor vehicle of some sort they are absolutely stranded, and the motor cycle, on account of its low first cost and the small outlay needed in its upkeep, is obviously the means of travel for all who cannot afford a car. Men join the Forces and go to the Front, and those who come back (not all, alas!) quickly return to their old love.

If the whole motor cycle industry, save for a few firms supplying Government machines, must lie dormant during the war, progress will be seriously hampered, and when peace once more reigns in this land of ours the British motor cycle, which has hitherto led the world, will receive a serious set-back.

## Push and Go!

**I**T has been stated in the House of Commons that the Government, acting through the Board of Trade, propose to take steps to allow the naval and military authorities first claim on all available supplies of petrol, public and commercial traction services second consideration, private consumers to be considered last. If this "drastic" announcement means anything it insinuates that hitherto military supplies of petrol had been interfered with by the supplies necessary for private consumption, but this is not the case, and we deplore the inference. But if it were justified, upon whose shoulders does the fault rest? Is it not extraordinary that we have seen nineteen months of war before the Board of Trade has discovered this fact? Beyond stating that there is not a single motorist to-day who would use a pint of petrol if he knew that he was depriving the Government of it, we will only observe that the announcement strikes us as another of those irresponsible utterings designed to stir up the prejudice of the non-motoring public against motorists. The announcement was made in the House by Mr. Lloyd George, whose activities we all admire, but the latest utterance can hardly be associated with the "Push and Go" for which he has become famous.

## A New 2½ h.p. A.B.C. Lightweight.

An Interesting Experimental Machine having a Horizontally Opposed 60×40 mm., 226 c.c., Engine

**F**EW engineers have shown more inventive genius in the construction of motor bicycle engines than Mr. Granville E. Bradshaw, the works manager of A.B.C. Motors, Ltd., Hersham, Walton-on-Thames. The little machine which we illustrate and describe herewith is, curiously enough, the outcome of the war. It is not intended to place it upon the market at the present time, but it has been built purely as an experiment. The tiny 226 c.c. engine was designed originally for the purpose of driving dynamo sets for the Government, being especially suitable for this purpose on account of its even torque and excellent balance. To test the engine to destruction, and also with a view to seeing how it would behave under road conditions, it has been placed in a motor bicycle frame, and a very charming little machine has been the result.

It will be noticed from the illustration that the frame is of somewhat strange

Off side of the new 2½ h.p. horizontal twin-cylinder A.B.C.

been fitted, in which the exhaust is underneath. The gear ratios are 6½ and 11 to 1, and on top the machine is said to do 48 m.p.h., and the maximum

with which he expects to obtain much finer results. At present, he tells us, the engine develops 4½ h.p. at 4,500 r.p.m. The saddle has an extremely low position, and is only 27in. from the ground. No valve lifter has been fitted up to the present, as this machine is not designed to take one, being originally intended for stationary purposes, but the machine is quite easy to paddle off from a standstill.

A machine of striking appearance—the 2½ h.p. twin-cylinder A.B.C. lightweight.

design, and the reason for this is that it was never intended to take this tiny engine, being originally constructed for a spherically headed engine, which was to have been built for racing purposes, but the production of which was stopped owing to the war; consequently the frame and forks are heavier than necessary. Moreover, the tyres are 2½in. in diameter, and therefore the total weight of the machine is over 100 lb., whereas, if it were built in a suitable frame, the weight, we are told, would not be much more than 75 lb., or 85 lb. with rear springing.

The interesting little engine, the design of which follows A.B.C. lines more or less entirely, weighs 14 lb. exclusive of magneto, carburetter, and flywheel, which add another 13 lb. The bearings are of the roller variety, and the bore and stroke are 60×44 mm. respectively. Lubrication is by means of a mechanical pump.

### Aluminium Pistons.

The pistons are of aluminium, and weigh 3 oz. each. So far as outside appearance goes, the only difference from the 500 c.c. A.B.C. engine is that a different type of cylinder head has

speed on the level on the low gear is claimed to be 37 m.p.h., at which speed the engine would attain nearly 5,500 r.p.m. An ordinary standard camshaft is fitted, but Mr. Bradshaw hopes to make a special high efficiency camshaft

We took the machine out for a short run, and found it delightfully smooth running, being even better balanced than the 500 c.c. Although the Claudel-Hobson carburetter had not been properly adjusted, the machine had a fine turn of speed, and took quite a steep hill on top gear with ease. At the present moment an Albion two-speed gear is fitted, and with a view to testing the smoothness of the engine the chain drive is solid—that is to say, no transmission shock absorber is incorporated. We were very much interested to be told of this fact, because we should never have thought it the case when actually riding the machine.

### THE ADAPTABLE MOTOR CYCLE.

A Scott, minus front wheel and handle-bars, rigged up in an R.N.A.S. repair shop to drive a lathe. Another is used to drive a dynamo.

# Occasional Comments by "Ixion"

## One Approving Voice.

I have only heard one man speak approvingly of the recent official circular about the abolition of pleasure motoring. He owns a 1906 accumulator ignition X—. He says he never uses it for pleasure, but that the labour which he usually expends on starting it would suffice to build three super-Dreadnoughts.

## Festina Lente.

The old motto "Make haste slowly" seems worthy of remembrance in an age when the single-cylinder two-stroke is still so far from perfect, and one nevertheless hears of bold experimentalists who are busied with multi-cylinder two-strokes. The job is by no means impossible—witness the manifold excellences of the Scott power unit. But I think our engineers should polish up the average single-cylinder baby a little before they launch out in more ambitious fields. With few exceptions it is far behind the average four-stroke in general development, though its intrinsic merits render it so eminently usable, even in its crude state of immaturity.

## The Petrol Famine.

In the district where I was staying last week-end, neither the Pratt nor the Shell agents had "even a leak" in stock; neither of them knew when further consignments might be expected. As a consequence, we mobilised a number of sidecars and light cars, and went the round of the garages within a certain radius, buying up old cans, mostly of the Taxibus grade. At this rate there will soon be a run on paraffin carburettors. What are the real facts of the situation? Is the Government secretly taking subterranean action, or is there a shortage of tank steamers and dock labour? The American Government has made it abundantly plain that the obstruction lies on British shoulders, as the stocks on the other side of the Atlantic beat all previous records.

## An Interesting Problem.

"F.C.J." has a 1912 7 h.p. Indian sidecar outfit, which has covered 20,000 miles without causing him any trouble. Recently a very distressing knock made its appearance; it was not the ordinary knock, such as results from carbonisation, worn bushes, or overloading; he describes it as creating the sensation of some unseen force hammering at the tank; the whole machine vibrated abominably, especially when changing gear or opening out. On looking round for the seat of the trouble, he expected to find the engine just hanging on by the last thread of the last bolt, or that a kind friend had put a 2 lb. hammer head inside the tank. Whilst investigating, he noticed that the tappet clearance at the overhead inlet valves was excessive, and adjusted till there was practically no clearance at all with the engine hot. On restarting the engine he found to his amazement that the knock had entirely disappeared, and that the usual liveliness and vigour

of the engine had returned in full measure. He desires our readers' explanations of this curious phenomenon.

## Light Car v. Motor Cycle.

I have just completed a long run in company with a very speedy light car and an 8 h.p. sidecar outfit, my own solo mount being a  $3\frac{1}{2}$  h.p. twin. I belong to that breed of rider who is a road-burner when surfaces and other conditions are safe, but, being afflicted with plenty of imagination, go very canny on grease, in traffic, and amidst cornersome places generally. Both my companion Jehus were of the absolutely nerveless order, and out for blood from start to finish. Nevertheless, I was always waiting for them to turn up at points where it was possible that we might take separate roads. All this shows how much faster the motor bicycle is in serious cross-country work than any other type of motor. I gained yards or furlongs on the light car up every hill, and round every corner where complete vision was impossible. The 8 h.p. sidecar was apparently a shade slower than the light car in corner work, perhaps because its brakes were less effective, as is usual in this particular comparison; but it gained enormously on the car up any and every sort of slope. It lost to me at corners and up straight hills.

## Tricycles.

I have received a few letters about tricycles, one of which illustrates the thoughtlessness of the prejudice against them. The writer remarks (quite truthfully) that the engine of his 1899 De Dion tricycle possessed but one rate of revolution on which throttle positions had no marked effect, and that the gear drive resembled a rock-crushing machine. Exactly; the one fault was due to the automatic inlet valve and the other to a crude and obsolete transmission. If these were the most serious objections to the ancient tricycles, a strong case exists for their revival, as these and many other drawbacks could not conceivably be reproduced in a modern development. *No modern engineer has seriously experimented with a modernised tricycle*; and it is at least possible that a solo three-wheeler, developed up to the limits of modern knowledge and modern practice, might prove a better all-weather machine than anything which we now possess. The interest taken some while ago in Mr. A. V. Roe's suggestion for a weatherproof non-skidding motor bicycle points to a demand. The main merits of that design were the complete protection of the driver and the provision of movable side struts, which enabled the machine to stand up when not in motion; its main defect was that it could skid at least as badly as the ordinary two-wheeler. A modernised tricycle would share all these merits, plus practically total immunity from skidding and complete accessibility of the vulnerable rear tyres. It could have a canoe body, in which the driver could recline, wearing no other storm-protection than a heavy coat; and even

**Occasional Comments.—**

this could be dispensed with if a low celluloid wind-screen were fitted. If two 3in. rear tyres were employed, mechanical springing would hardly be needed, punctures would not occur till after 5,000 miles usage, the tyres would run 8,000 miles per set, and a puncture could be repaired by slipping in a new tube. A noiseless and highly efficient transmission could be arranged with ease, engine and occupant could be mounted near the centre of a long wheelbase, and the demand from all-weather riders might become enormous.

**"Top Feed" Carburetters.**

I think some carburetter maker had better come out into the open to defend the placing of the petrol pipe union on the top of the float chamber instead of below it—the universal location until very recently. I believe the reason of the change is a desire to minimise flooding due to the needle hopping about under road vibration, and I am sure the new pattern

(3.) The shortened petrol pipe is more subject to air locks.

(4.) "Top feed" carburetters have no competition successes to their credit.

**The Other Side.**

Pending authoritative statements by one of the culprit manufacturers, I do not personally regard the above quartette of indictments as remarkably sound. The filter can easily be transferred to an upward bend in the pipe so that dirt is pushed against the lower side of the gauze by the flow of spirit, with a chance of dropping away from it; or, better still, a larger diameter filter can be used. I rather fancy that there is little difference between the two types of filter; surely the flow of spirit keeps dirt pressed against the underside of the gauze in the older type of filter? I do not see that the bayonet joint cap need be sacrificed, provided a hexagon is cast on it so that it can be steadied with one spanner whilst a second spanner

is applied to the union nut. Air locks do not occur on any properly designed petrol feed system; but may occur with either type of carburetter if the pipe passes near the exhaust pipe, if the whorls are in the vertical plane, or if the tank vent is inefficient. "Top feed" carburetters have not been long enough on the market to stand a chance in competitions. I think these four indictments are comparatively negligible, and that, on the other hand, the "top feed" system reduces vibration-flooding quite appreciably. Will some maker weigh in with his standpoint and other keen riders with their views?

**A WINTER RUN IN THE HOME COUNTIES.**

is successful in this respect. A week or two ago a reader complained bitterly that it rendered the float comparatively inaccessible, and—rightly or wrongly—I disagreed on the score that the tickler always informs you whether there is spirit in the chamber, and that one seldom needs to inspect or remove the float. One of our ablest amateurs takes quite a contrary view for the following reasons:

(1.) The filter is in the wrong place; the dirt lies on the gauze and chokes the supply of petrol.

(2.) The bayonet joint fitting of the float chamber lid is sacrificed.

(Upper) A pretty view on the London-Broxbourne road.

(Lower) An ice-covered road near Ware, Herts. Photographs taken during a sidecar run with a convalescent soldier as passenger.

## The Scott Self-contained Sidecar.

IN *The Motor Cycle* of November 4th, 1915, there appeared an illustrated description of a three-wheeled sociable sidecar, the invention of Mr. A. A. Scott. The illustrations now published show alternative designs of the chassis, but even these are likely to be modified before the final vehicle is produced. The side view and plan reproduced herewith show one construction which is illustrated in that patent specification, and they make clear the principles involved. As will be seen, the frame consists of two parallel longitudinal members with transverse members at the ends. Intermediate of these are two other cross-members which are extended beyond the side members to form a bed for the engine. The latter is mounted upon short bearers between these two cross-members, and it will be noticed that the engine lies more or less in the plane of the two side wheels. There is a back axle which is shaft driven, and spring suspended from the frame very much on car lines, except that the propeller-shaft is at one side. The front wheel is on the same side as the engine, and is carried by a pivoted frame which is coupled by a strong leaf spring to the main frame. The general design is a blend of motor cycle and sidecar and motor car practice, the chief features being that both rear

wheels are driven, and there is no vertical frame carrying tanks, etc. And while the vehicle previously described was made up entirely of tubular members, one of the alternative forms illustrated herewith is constructed of pressed steel side and cross members. No. 1,294, 1915. A. A. Scott.

Alternative design propelled by a V-type twin-cylinder engine having a countershaft gear and belt drive to the rear wheel.

The new Scott three-wheeled sociable in elevation and plan. The engine is a 5 h.p. twin-cylinder vertical two-stroke.

## Lighting Tips.

### THE DISADVANTAGE OF TOO MUCH TUBING.

THIS winter I have experienced more than a moderate share of night riding, and abnormal winds and abnormal roads have taught their lessons ungrudgingly with regard to lamps. I started the winter with a good-sized generator, which supplied both head lamp and tail lamp, a length of brass tubing, running under the tank, connecting up the latter. I found that, unless the generator was in perfect trim, the pressure at the tail lamp was so slight as to produce a smoky flame, which was apt to go out on the slightest provocation. I then purchased a second generator, and ran the two interconnected, but was surprised to find that no greater pressure was obtained, while the eternal smell of gas warned me that a leakage was taking place through the needle valves.

All this trouble was simply and solely due to the loss of pressure caused by the great length of tubing used, it requiring the energy of the generators to pump the gas through the tubing, so that a weak flame appeared at the burners.

With ordinary generators the only way to obtain strong and steady flames at both lamps is (1) to have a separate generator to each lamp, and (2) to connect it thereto with as short a length of tubing as possible.

I have now mounted my tail lamp and generator on

the back of the sidecar body, so that they travel in a sprung position, and six inches of tube connects the two. The head lamp and generator are sprung with the handle-bars, and here, too, a six-inch length of tubing does it. There are no kinks and no corners, and the system is practically infallible. Lamp troubles vanished, indeed, immediately the long stretch of tubing to the tail lamp was discarded.

The length of brass tubing is still there, however, securely fastened at four points so that it cannot rattle, and by its use either of the generators can be made to light both lamps at a moment's notice should one give out, an extra length of tubing and a T connection being carried in the sidecar pocket for this purpose.

With regard to the metal tubing, great care should be taken, when bending it to fit, that no low point is left at which moisture can accumulate, as this will cause the tail lamp to go out repeatedly, and great difficulty may be experienced in locating the cause. Bind each point at which the rubber tubing is connected with insulation tape, as this will prevent perishing and splitting, and keep all the connections as short as possible. A spare length of tubing can be carried in the sidecar in case of roadside adjustments proving necessary.

H.M.B.

# THE AERO ENGINE.

## HOW WAR-TIME DEVELOPMENTS MAY HELP MOTOR CYCLE DES'GN.

(Previous instalments appeared in "The Motor Cycle" of December 16th and February 24th.)

**F**ROM the point of view of classification the next type to be discussed is the radial stationary cylinder engine; that is to say, an engine with cylinders disposed round the crank case in the same manner as the Gnome, but immobile, the crankshaft rotating in the orthodox manner. There is no question that the development of this particular type of engine owes much to the French constructor Anzani, and if there is a touch of the motor cycle in its design it is not to be wondered at, seeing the name that Anzani held in the motor cycle world.

Although the radial type of aero engine has much in its favour it does not seem to have made so much headway, in this country at any rate, as the V and vertical types. There is, however, an exception where big engines, such as the 300 h.p. Canton-Unne, for seaplanes are concerned. It is to the writer a moot point whether the comparative lack of popularity of the radial engine may be due to the disadvantages of the design, which are not great, to some conspicuous lack of success in some special case, to some unexplained prejudice, or to difficulty in obtaining an engine of the exact power and proportions required. There are undoubtedly many desirable features in the radial type. It is true that it lacks the advantages of the rotating cylinder type in the matter of smoothness and of drive. The torque of the radial engine may be as even, and the balance as good, but the flywheel effect of the mass of the revolving cylinders, pistons, etc., is missing. The radial engine has, however, certain advantages over the rotating cylinder. It can be made reasonably economical in consumption of lubricant and fuel—as economical, in fact, as an air-cooled engine of any type. There is no limit put upon its maximum speed of revolution by centrifugal force. If desired it can be produced as a water-cooled engine and made to show a reasonably high efficiency, and further it can be silenced, the last two being matters of difficulty, if not of practical impossibility, with the rotating cylinder type.

### The First Channel Flight.

From the point of view of the aeroplane builder there is against the radial air-cooled engine the same objection as to the rotating cylinder, that is to say, head resistance. In the case of engines of moderate power and size, i.e., 100 to 160 h.p., it is possible that suitable streamlining of the crank case or complete cowling of the cylinders might prove very beneficial, but the writer does not recollect any instance of this having been done.

There are many different radial engine designs, but the first to achieve any great popularity was the three-cylinder 25 h.p. Anzani. With the aid of one of these engines Blériot originally flew the Channel in 1909, that is, in the days when the Channel was to the

aviator a dangerous sea some 35,405,568 mm. across, each millimetre pregnant with unpleasant possibilities. Nowadays the Channel is more or less an incident in the day's work or a twenty minutes' long hop.

### The Three-cylinder Anzani.

This original type of Anzani had three cylinders 100 mm. bore x 150 mm. stroke; disposed like a fan around the top of the crank case, the two inclined cylinders making each an angle of 72° with the central vertical cylinder. The two worst features of this type from the point of view of design are that the firing impulses, and therefore the torque, are not delivered evenly. By reason of this fairly heavy flywheels are essential, and, owing to the disposition of the three pistons and the three connecting rods attached to a common crank pin, balance weights of considerable size become necessary. The design of the engine was simplicity itself, the cylinders were of cast iron with a number of fins, and the exhaust valve was at the rear of each cylinder with an automatic inlet valve carried in a cage above it. In the light of latter-day design the engine could hardly be regarded as very efficient. The valves were small, and for a cubical capacity of 3,534 c.c. a horse-power of only 25 was claimed at a speed of 1,300 to 1,400 r.p.m., whereas under modern racing car conditions an engine of the capacity would develop over 100 h.p.—perhaps an unfair comparison by virtue of cooling systems and speeds. After Blériot's initial success across the Channel many of these engines were fitted into various monoplanes, and any frequenter of Brooklands in those early days must recollect daring people just managing to wobble up into the air and keeping there with luck for ten minutes or so at about 100 feet or less before coming down, the duration of flying generally being limited to the time during which the maximum power could be got out of the engine without serious overheating. We do not mean to imply that the poorness of the performance was entirely due to the engine. It was simply that 25 h.p. was being used where something like 50 h.p. was really necessary.

The early Anzanis had two little habits. Most of them were provided with auxiliary exhaust ports consisting of holes drilled round the bottom of the cylinders and uncovered by the piston when the latter was at the extreme of its travel. These ports rather weakened the cylinder walls and a good many cylinders were blown off, whilst when starting up the engine if one carelessly flooded the carburettor quite a gratifying fire would arise if a flame from the auxiliary port set light to the flooding petrol.

This particular three-cylinder Anzani was afterwards superseded by another type which had considerable advantages over it. In this case the cylinders were placed at intervals radially around the crank case

**The Aero Engine.—**

in the form of a letter Y, the tail of the letter being uppermost and the space in the fork at the bottom being occupied by the carburetter. The cylinders were  $120^{\circ}$  apart, and the torque was very reasonably even, there being an explosion at every  $240^{\circ}$  of crankshaft revolution. The balance of this engine was fairly good. The inlet valve remained automatic, but the exhaust valve was then placed in the head and operated by means of a rocker and push rod. To get at these valves it is necessary to take the cylinders off, and, although this may strike one as a serious defect in any kind of petrol engine, the writer is rather coming round to the opinion that accessibility of the valves is of secondary importance nowadays, and will develop his views of the matter later in the article.

Whereas in the original Anzani the cylinders were attached by means of bolts passing through flanges at the feet, in the Y-type lugs are provided in the head through which a long bolt extends to the crank case on each side of the cylinder. In the fan type of engine the three connecting rods were all situated on the same crank pin, two of them being forked. The arrangement of the Y type, however, is quite different and rather interesting. Mounted on the crank pin is a bush. The end of each connecting rod consists merely of a simple saddle which beds snugly on the outside of the bush. Around the

edges of the saddles on each side are locking rings.

Some little space has been devoted to the Y type engine because it seems a design which might possibly commend itself to the motor cyclist. The torque is more regular than in the two-cylinder horizontally-opposed engine, and it is possible that such an engine might be made lighter for an equivalent power or more powerful

for the same weight, since so heavy a flywheel is not necessary.

**A Comparison.**

Figs. 1, 2, and 3 have been prepared to give some idea of the comparative sizes of two, three, and five-cylinder engines, all of 500 c.c. capacity. The drawings do not pretend to be designs, only simple diagrams conforming to reasonable proportions. Fig. 1 is a two-cylinder horizontal opposed engine,  $68 \times 68$  mm.; fig. 2 a three-cylinder,  $60 \times 60$  mm.; and fig. 3 a five-cylinder,  $50 \times 50$  mm. In each case a ratio of 1 to 1 for the bore/stroke has been taken as a fair value, and a connecting rod length of  $2\frac{1}{2}$  times stroke. In the engines with the greater number of cylinders it might be allowed to alter the bore/stroke value to 1.25 to 1

or more, and employ a lesser connecting rod length, so that the five-cylinder engine might be reduced still further in size. No allowance has been made for magneto, carburetter, and silencer positions. Doubtless these will occur to the reader. No insuperable obstacles appear, however. The proposition of the five-cylinder engine is put forward as a matter of interest; only experience could show the advantages or disadvantages in their true relationship. The five-cylinder radial might give in practice a smoothness of running and an even torque as good as, if not better than, a six-cylinder car, also the weight of five cylinders, as against two larger ones, might be more than counterbalanced by the saving in flywheel mass. The design could be arranged to place the cylinders in any convenient position; that is to say, it does not matter whether one cylinder points vertically downwards or vertically upwards. Under modern conditions of roller bearing big ends, pump lubrication, proper piston design, and reasonable care, there should be no trouble either with oiling or soot-ing up.

To return to the aero engine, the Y type Anzani was

**A COMPARISON IN SIZE BETWEEN 500 c.c. ENGINES OF TWO, THREE, AND FIVE CYLINDERS RESPECTIVELY.**

Fig. 1.—Two-cylinder  $68 \times 68$  mm. bore and stroke.

Fig. 2.—Three-cylinder  $60 \times 60$  mm. bore and stroke.

Fig. 3.—Five-cylinder  $50 \times 50$  mm. bore and stroke.

Fig. 4.—A diagram showing why radial engines generally have an odd number of cylinders to each crank pin. The above is a six-cylinder engine firing in the order of 1, 3, 5, 2, 4, 6, 1, with a wide gap between 5 and 2, and a short gap between 6 and 1.

Fig. 5.—Another diagram having the same object as fig. 4. The above is a seven-cylinder engine, the firing order of which is 1, 3, 5, 7, 2, 4, 6, 1, giving an equal spacing between each firing impulse.

**The Aero Engine.—**

followed by a six-cylinder engine which really consists of two three-cylinder groups and a double-throw crankshaft. A further development was the production of a five-cylinder engine with the cylinders in the same plane and working on a single crank pin. This engine in turn was duplicated, making a ten-cylinder engine with a two-throw shaft.

It has probably occurred to those who are not already aware of it to wonder what is the reason that radial engines always have an odd number of cylinders rather than an even number. The simple diagrams (figs. 4 and 5) on the previous page serve to explain it. Unless the number of cylinders actuating one crank pin be odd, it is impossible to get a perfectly even torque. That is to say, the explosions will occur at slightly different spacings of a revolution of the crank-

shaft. This, of course, pre-supposes that a crankshaft of an even regular form is employed if there is more than one crank pin.

Fig. 4 shows the firing diagram of an imaginary six-cylinder engine, and fig. 5 is a diagram of a seven-cylinder engine. It is obvious that in fig. 4 the six cylinders cannot fire in direct sequence, otherwise they would all have fired in one revolution of the crank pin, and the second revolution would take place without a single impulse. The alternative is to make them fire alternately—that is, in order 1, 3, 5, 2, 4, 6, 1, and so on—but this means a wider gap between 5 and 2, and a short gap between 6 and 1. With the seven-cylinder engine, however, the firing order is 1, 3, 5, 7, 2, 4, 6, 1, etc., which, it will be seen, gives an equal spacing between each impulse.

M.T.

*(To be continued.)*

## The Handle-bar Controlled Clutch.

### Is it a Luxury or Necessity?

FOR some months past I have ridden a  $3\frac{1}{2}$  h.p. machine fitted with handle-bar clutch, and, though previous to this experience I considered such a clutch a very nice and useful thing to possess, I have now come to regard it in the stern light of an absolute necessity in the case of a single-cylinder machine with sidecar attached. Only when I get astride a machine fitted with a less accessible clutch control do I realise how much I use the clutch on my own mount, and of what immense value it is in saving the engine, tyres, and transmission throughout. I have become so used to using the hand clutch that the ordinary system of control now appeals to me as almost brutal, there being no efficient way of relieving

the load of the engine at the crucial moment without losing considerable headway.

One immense advantage of the handle-bar clutch is in the quickness with which the machine can be made to pick up after rounding a corner or passing traffic. One can keep the engine thumping at its best, the clutch just sufficiently eased to take off the dead resistance which would otherwise cause a konk, and thus full headway is again obtained in surprisingly short distance. In the same way one is able to pick up from middle to top on gradients which would necessitate a long grind on middle were one unable to manipulate the clutch with extreme delicacy. I am also the possessor of a 7 h.p. twin, but the  $3\frac{1}{2}$  h.p. simply leaves it standing on a tortuous route—the only explanation being that one can use the clutch of the latter to the best advantage.

Of course, all this slipping means wear of the clutch plates, but what of it? It will take a very long time for the plates to wear out, and I can then have them renewed for a very few shillings, which will be more than made up by the reduced wear on engine, tyres, etc.

I have no doubt whatever that the handle-bar clutch will increase in popularity, and the man who takes a pride in the tune of his engine will find that half the secret of maintaining concert pitch lies in his ability to relieve the engine of heavy loads at low speeds. Allowing an engine to "rev." does no harm whatever; it is the "konk-konk-konk" that spoils its tune quicker than anything.

H.M.B.

C. Hall, of Young, New South Wales, and the  $3\frac{1}{2}$  h.p. Singer, on which he has covered 20,000 miles. Mr. Hall is a Singer enthusiast, and tells us he has won many prizes with his mount, one of the machine's best performances on the road being the accomplishment of thirty-two miles in forty-five minutes.

A new oiling system, particulars of which we are at present asked not to divulge, has been invented by Mr. A. S. Baylis, one of the designers of the Junior Triumph. This new lubricating system will be equally suitable for use with any type of engine. The special point in connection with this system is that the amount of oil supplied to the various parts will be controlled by the throttle opening; thus when the throttle is open wide and the engine working hard the amount of oil is increased, while when running light the oil supply is diminished.

# "The Motor Cycle" Recruiting Section.

A further call for Motor Cyclists for the M.M.G.S.

Some of last week's recruits in the Motor Machine Gun Service. The central figure is Captain Kay, the Coventry recruiting officer, and on his right the Editor, Mr. Geoffrey Smith, who is inspecting officer for the M.M.G.S. and R.E.

ON going to press a telegram from the Officer Commanding the Motor Machine Gun Service to Mr. Geoffrey Smith, Editor of *The Motor Cycle*, calls for several hundred more recruits.

Motor cyclists prepared to join immediately need only send in the form of application on page 240, when they will be advised as to the next date of inspection, provided, of course, the particulars are in order.

To minimise the work entailed in dealing with the large number of applications received (amounting to nearly 400 in a week), recruits are urged to note particularly the following instructions:

Fill in answers to each question carefully, and particularly the date upon which you could join the Colours.

Do not apply until you are practically ready to join. (Many send in forms mentioning at the same time that they have applied to their local tribunals for exemption, whilst others ask to be accepted and join up with their groups in two or three months' time. Such applications cannot be dealt with.)

A number of riders who have been on the different waiting lists of inspecting officers of the Royal Engineers (Signal Section) for some months were enrolled in the M.M.G.S. last week. Preference will be given to other riders passed for the R.E. if such will apply, attaching the R.E. slips of acceptance to the M.M.G.S. form of application on page 240.

Queries as to vacancies in the R.N.A.S., R.F.C., A.S.C., and other sections continue to reach us. Readers may save needless correspondence if they will note that the M.M.G.S. is the only motor cyclist section open for immediate recruits.

Briefly, the terms of enlistment in the M.M.G.S. are as under:

Age limits 19 to 40.

Pay 1s. 2d. per day, all found; usual separation or dependents' allowance.

Overseas service.

Single as well as married men may be accepted for the M.M.G.S., provided they have not received notice to report at their local recruiting offices before the date of the M.M.G.S. inspection.

Applicants must be of good physique and possess good eyesight. Glasses do not debar necessarily men from service in this section, provided they can see quite well with them.

Those who desire to join immediately need not write at all, but should attend the Recruiting Office, Masonic Hall, Coventry, to-morrow (Friday) afternoon, 2.30 to 4 p.m., prepared to proceed to their training centre. Mr. Geoffrey Smith will be present to accept all suitable men.

In the latest list of recruits on this page are a number of Colonials, several of whom could drive cars. They were billeted in Coventry on Friday night, and proceeded to the training camp next day.

A list of men accepted last week for the Motor Machine Gun Service is given hereunder:

Ainger, H., Royston.	Hunt, D. G., Blandford.
Ballinger, A., Leamington.	Islip, G. A. K., Birmingham.
Bardill, H., Calverton.	Jones, J. H., Shrewsbury.
Beem, R. H., Hinckley.	Jowett, A., Bradford.
Bendle, W. S., Torquay.	Johns, J., Sheffield.
Beresford, G., Coventry.	James, W. H., Smethwick.
Binns, W. H., Moston.	King, J., Sandy.
Blackledge, G., Great Harwood.	Lyle, C. J., Portsmouth.
Boroughs, H., Cirencester.	Millward, —, Macclesfield.
Boughton, L. H., Birmingham.	Mansfield, C., Coventry.
Bridgwood, T., Macclesfield.	Marks, B., Leicester.
Brough, J. H., Middlesbrough.	Mills, E., Hinckley.
Burton, G. H., Wilberfoss.	Minifie, F. C., Peckham, S.E.
Barton, A., Long Sutton.	Myers, jun., J. B., Dalkeith.
Carter, C. W., Leamington.	Nelms, F. R., Coventry.
Cotton, S. E., Loughborough.	Norman, C. J., Coventry.
Clarke, F., Aston.	Norman, S. G., Handsworth.
Clarke, C. C. F., Louth.	Nutman, H. H., South Norwood, S.E.
Clark, J. W., Corbridge-on-Tyne.	Ouseley, G. R., Bournemouth.
Coffey, R. S., London.	Penny, W. H., Taunton.
Cooper, G., Edinburgh.	Powell, W. W., London.
Cox, D. B., Redditch.	Pullan, J., Ripon.
Cressey, W. S., Hull.	Ranson, F., Bowes Park, N.
Cummins, G. O., Birmingham.	Richardson, C. S., Forest Gate, E.
Craig, T. D., Chesterfield.	Robertshaw, W., Idle, nr. Bradford.
Croper, H. C., London.	Rood, B., London.
Daglish, A., Crook.	Sharp, T., Sheffield.
Eastwood, R., Great Harwood.	Shepherd, H. T. P., Chester.
Emsley, A. E., Morecambe.	Shilcock, W. B., Coventry.
Faulkner, E. L., Rotherham.	Sharman, B. A., Chesterfield.
France, J. E., Wallasey.	Stevenson, J. W., Bletchley.
Forward, E. R., Leicester.	Stokes, F. R., Malvern.
Foster, W. E., Mansfield.	Taylor, W., Skewen.
Gallagher, J. G., Ormskirk.	Taylor, S., Walsall.
Gatril, J. W., Grimsby.	Tunn, J., Olney.
Gifford, H., Grimsby.	Vickers, R., Birmingham.
Godfrey, R. C., Evesham.	Wagstaff, A. T., Birmingham.
Goodfellow, C. T., West Dulwich, S.E.	Walton, G. T., Wisbech.
Hackford, F., Lenton Sands.	Watson, J. O., Birmingham.
Harwood, J. W., Longfield.	Warwick, E., Leicester.
Hulme, H. D., Coventry.	Whitaker, F. B., Dollis Hill, N.W.
Humphreys, H. W., Gravesend.	White, A., Colchester.

(See page 240 for M.M.G.S. application form.)

# THE HERCULES SIDECAR.

An Attractive Sidecar incorporating Several Novel Features.

**F**EW sidecars have a greater number of attractive features than the Hercules, manufactured by Messrs. the Hercules Motor and Cycle Co., Ltd., Birmingham. The chief aim throughout the design of the chassis has been the reduction of tubes and brazed joints, the result being lightness, simplicity, and considerable strength. The main frame of the chassis consists of one weldless steel tube constructed in U-

Coachbuilt model Hercules sidecar. Note novel type of front springing.

shape, the two free ends of which are then carried upward at the rear for some distance. Attached by two substantial lugs to the two uprights thus formed are the main wheel axle, which also forms the lower frame attachment, while above is situated another crossbar, which carries the spring shackle fittings, and the connection for attachment to the saddle stay of the cycle; this also forms the main support for the mudguard. By this arrangement the chassis is considerably dropped below the level of the axle, and the riding position of the body is placed extremely low.

## Three or Four-point Attachment.

Three points of attachment to the cycle are standard, but four may be obtained for heavy twin outfits if desired. The rear main connection is of the ball joint variety, and by this means perfect alignment is assured, as in whatever position the other connections are adjusted the ball joint ensures the axle being pulled

Storm apron, which can be fitted to Hercules sidecars.

up to correspond without throwing any strain whatever on either the sidecar chassis or cycle frame. The large nut can then be tightened and secured by a simple locking device. The front connection is formed on the principle of the self-centring lathe or drill chuck. A split sleeve is fitted over and pinned to the tube from the sidecar, which is attached to both sides of the main chassis frame. Externally this sleeve is slightly tapered;

the lug attached to the cycle frame into which this tube and sleeve fit is also slightly tapered, so that when pulled up tightly by the locking nut, it forms a most solid connection, while the slight jamming action caused by the split tube attempting to expand overcomes any tendency for the securing nut to become loose. The third connection to the saddle pillar is attached to the upper rail of the rear portion of the chassis, and in order to prevent give or whip in this, a cross tube forming a triangulated connection, ensuring absolute rigidity, is fitted. This cross bar in no way interferes with the easy detachment of the connection.

## Mudguard Fixing.

The method of attaching the mudguard to the chassis is most noteworthy. This is carried out by bolting the guard by means of a substantial plate direct to the upper rail of the chassis. In addition to this it is secured by two stout stays both front and back, and the attachment thus obtained is absolutely rigid. The rear stay also forms a stand for the wheel when required. The hub is efficiently protected from water and mud by the addition of a neat extension of the axle lug, forming a cover and gutter which throws any mud and water that may run down the mudguard stays, etc., quite clear of the bearing.

The springing is well and neatly carried out, the body being supported on short, semi-elliptic springs in front, while the back is supported on the curiously arranged combination of semi-elliptic and C springs.

The bodies, which are of one shape only, can be obtained in almost any colour to match all the leading makes

Ball joint attachment (above) and hub guard combined with mudguard stay supports on the Hercules sidecar chassis.

of motor cycles, the finish being really excellent, and the makers claim that a man could see to shave himself comfortably in the glossy finish of the varnish.

## "TOUR OF THE JACK PINES."

Advance particulars that have reached us of a three days reliability trial, to be held next July by a Michigan, U.S.A., club, are of interest as showing the keen manner in which organising bodies of motor cycling competitions in America commence early to seek a large entry list. The Grand Rapids M.C. is the organising club, and 750 miles will be covered in three days. The trial is called "The Tour of the Jack Pines" by reason of a portion of the route embracing the pine forests of northern Michigan. We are told that "a 'place' in this universally important event should be the desire of every true red-blooded enthusiast."

## A WELL-DESERVED REST FOR DESPATCH RIDERS.

The men shown took part in the Dardanelles operations and are now doing duty at a base in Egypt. The photograph comes from Cpl. S. Langford, R.E., who, with Cpl. Leahy, of the same Signal Company, sends greetings to any riders of the company who may have returned to England.

## Obstacles to Overseas Exports.

Manufacturers' Experiences Invited. An Improvement in the Export Conditions Foreshadowed.

FROM time to time complaints have reached us from manufacturers concerning the difficulty in exporting motor cycles to countries abroad. It will be recalled that we have dealt with the subject on divers occasions of late, and urged the desirability of better facilities being granted to manufacturers to act upon the good advice of the Board of Trade to specialise on Overseas orders. From experiences which have reached us it is abundantly clear that there is often considerable delay in licences being granted from the Board of Trade to export motor cycles abroad, and also when these are obtainable a further delay ensues at the docks even if the manufacturer is lucky enough to persuade the railway company to collect the goods without delay. It would appear from information which has come into our possession that

an improvement in these transit arrangements may shortly be expected.

This announcement is made with considerable pleasure, as nothing to our mind is so empty as to appeal to manufacturers to capture enemy trade, and to specialise on exports to bring much needed gold into the country, when it is common knowledge that there are all sorts of real obstacles in the way.

Those manufacturers interested in the Overseas market, and who have experienced delays in the export of motor cycles or accessories abroad, are asked to furnish us immediately with particulars of specific instances where licences to export motor cycles have been refused, or where delays have occurred on the railways or at the docks. This information may expedite the improvement to which we have referred.

## A Luxurious Sidecar Combination.

A First-class Sidecar preferred to either Car or Light Car.

THE owner of the magnificently-appointed 8 h.p. 1916 model Sunbeam and sc. which we illustrate herewith is a sidecarist of many years' standing. Becoming ambitious he tried a light car, but was not at all satisfied with its slowness on hills, and so went in for a touring car. This he found too expensive to run, so, having come to the conclusion that a good motor cycle and sidecar is the most sporting passenger vehicle one can possibly enjoy at a minimum of expense, he decided to purchase the finest example of the type that money could procure. The outfit under consideration cost close on £160. It is, of course, splendidly equipped. It is finished in the well known Sunbeam all-black style, it has Lucas dynamo lighting, complete with lamps, horn,

switchboard, enclosed drive, A.K. knee grips, an electrically illuminated Stewart speedometer, and a most luxurious sidecar with hood, screen, and side curtains. The sidecar body is of beautiful design, carries the spare wheel attached to a special bracket, and has a spacious luggage carrier. The body itself is very roomy. One of the photographs shows the neat method of carrying the A.C.U. badge on the horizontal spindle of the front forks. This outfit was supplied by the Service Co., Ltd.

We have referred to the new 8 h.p. Sunbeam power unit quite recently. The engine is an M.A.G. twin-cylinder 8 h.p.,  $82 \times 94$  mm. = 992 c.c. Apart from the engine the 1916 8 h.p. Sunbeam remains practically the same as the 1915 6 h.p. model, which it replaces.

An expensive Sunbeam sidecar outfit. Note the spare wheel carrier, the novel place in which the A.C.U. badge is carried, and the side curtains provided for the hood.

## TIMES TO LIGHT LAMPS.

## GREENWICH TIME.

March	9th	...	...	6.21	p.m.
"	11th	...	...	6.25	"
"	13th	...	...	6.28	"
"	15th	...	...	6.31	"

## Motor Cycles at Woolwich.

The increasing use of motor cycles amongst Woolwich Arsenal workers is marked. They can store their machines in part of the premises, and garages and stores in the vicinity are also used. But for his motor cycle, one worker, who lives fifteen miles away in Kent, would need to live at Woolwich.

## Australian Half-mile Record.

L. Hope, of Perth, W.A., riding a  $3\frac{1}{2}$  h.p. Sunbeam, covered a half-mile at the beginning of the year in 26s. The previous record, 27s., was made by another Sunbeam rider, H. V. Norton, two years ago. In addition to being a Western Australian record, Hope's performance is, we understand, also a record for the whole of Australia.

## The Dublin Programme.

The question of holding competitions during the present state of national affairs has for some time past been exercising the minds of the committee of the Dublin and District Motor Cycle Club. The subject was brought to a head last week, when a special meeting of the committee was held to consider the matter of fixing a programme of competitive events. The committee decided to adopt the recommendation made to it by the general meeting, namely, to reduce considerably the number of events held last year and to confine the programme to the trials that have come to be regarded as the leading fixtures of the season. Consequently many of the minor events—those that partook of the nature of Saturday afternoon affairs—have been dropped, while the number of events at Portmarnock has been reduced to one. The usual open trials will be held at Easter and Whitsuntide, both of these being one day events, and at the August Bank Holiday the open two days' trial to Glengarriff and back will take place. The open twenty-four hours to Donegal and back will be held at the end of June, and a reliability trial will be held on St. Patrick's Day (the 17th inst.). The programme will probably be added to by a trial for prizes presented by Mr. R. J. Dodd, the hon. solicitor of the club, a corresponding event held last year proving very successful. Just at the moment the difficulty seems to be whether the usual competitors in Irish events will be able to secure any machines with which to compete in these events.

## The Wastage of Petrol.

A correspondent assures us that in a certain town in the South the sixty lorries belonging to the Army Transport Section have their engines run for an hour daily "to keep them in order." Our correspondent wishes to know whether we should advise him to adopt the same procedure with regard to his sidecar, so that the machine shall be in good tune when the war is over and he returns from his military duties.

## Sending Motor Cycles by Rail.

The attention of motorists is particularly drawn to the necessity of complying with railway requirements when vehicles are sent by railway. The byelaws covering the transit of motor cars and motor cycles by rail forbid the inclusion of any explosive spirit, and the companies are very strict in enforcing this rule. A motor cyclist member of the Automobile Association recently despatched his machine without removing all the petrol from the tank, and ultimately received a threat of legal proceedings from the company concerned. The Free Legal Advice Department of the Association was approached by the member, and correspondence ensued with the railway

## SPECIAL FEATURES.

THE WORKING OF A PETROL ENGINE.  
THE AERO ENGINE.

## A LUXURIOUS SIDECAR COMBINATION.

company, with the result that the company, as a special concession in this case, withdrew the instructions for proceedings to be taken against the member.

## A Date to Remember.

On Thursday, April 13th, *The Motor Cycle* annual Spring Number will appear. This is a week before the Easter holidays, and the issue will contain much information of interest and striking illustrations.

## "The Big Twin."

This is the title of a journal edited by present Etonians, and published by Spottiswoode and Co., Ltd., Eton. The first number, of which we have received a copy, is dated March 3rd, and even if subsequent numbers are no better *The Big Twin* should have a good following. The fifteen editorial pages contain a diversity of matter that is both instructive and amusing. We congratulate the editors on their first production, and wish *The Big Twin* the best of fortune.

## RECRUITING FOR MOTOR CYCLISTS IN SOUTH AFRICA.

Testing applicants for the motor cycle corps for the campaign in German East Africa. The machine is a 42 h.p. chain-driven B.S.A.

### Club Life in War Time.

The opening run of the Motor Cycling Club arranged for the 1st prox. was subsequently abandoned, though the Cyclecar Club recently carried out its opening run, and the same body now announces a "novel and easy form of competition for ladies."

### The National War Funds.

At the week end the principal national relief funds stood as follow:

The Prince of Wales's National Relief Fund (£3,073,000 distributed)	£5,803,558	0	0
Fund for the Sick and Wounded	3,417,069	0	0
Tobacco Fund	101,119	0	0
The Queen's Work for Women Fund	168,558	18	1

### Police Traps.

The Government is still bent on making "pleasure" motoring a pain. All round London, at any rate, the police continue their nefarious persecutions. There is a trap working at the Finsbury Park end of Blackstock Road, at the foot of a steep hill, and the trap is put just in a position where people would naturally accelerate before climbing this. Other Metropolitan traps too numerous to mention are being actively worked. We recently saw a motorist caught in Kensington High Street, the end of the trap being near the top of Victoria Road.

### Another Instance of Economy!

A clergyman living in a village in the Cotswolds uses his motor cycle for parish work at a cost, roughly, of 1s. per week. Now that the Government has restricted the supplies of petrol he finds that none is obtainable in his immediate vicinity, and he wrote to the A.C.U. for help in the matter, stating that if he could not get fuel for his machine he would have to hire a pony and cart at a cost of £1 per week. He concludes his letter by saying: "The Government, while telling people to save, is really driving them to extravagance." The A.C.U. has promptly placed him in the hands of its local repairer, and has ensured his now getting a regular supply.

### The Calthorpe Tank.

The unusual shaped tank used on the new Calthorpes (illustrated on page 203 of our last issue) is to be known as the Beta.

### The Petrol Supply.

Are we on the eve of petrol cards? All kinds of rumours have been floating about of late concerning Government intentions regarding the supply of petrol to the public, and now the most reliable information suggests that in the very near future petrol permits will be established.

### Sydney M.C.C. Twenty-four Hours Trial.

At the end of last year the Sydney, N.S.W., Club held a twenty-four hours trial. The start was from Sydney at 8 p.m., the final destination being Mount Victoria. The star performances were put up by the following three riders, who were the only ones to lose no marks:

A. E. Thomas (4½ h.p. B.S.A. and sidecar).

A. Biden (7 h.p. Harley-Davidson).  
J. Audsley (3½ h.p. P. and M.).

### 13,000 Miles to Enlist.

A motor cyclist recruit for the M.M.G.S. from Sydney, N.S.W., was aboard the *Clan MacTavish* when that vessel put up such a plucky fight with the German raider *Möwe*. The recruit in question is Mr. Arthur du Boisé, and an account of his interesting experiences will appear in our next issue.

### Economy.

The first poster issued by the War Savings Committee from the Public Trustee's Office begins with the words "Don't use a motor car and motor cycle for pleasure purposes. Don't buy new clothes needlessly. Don't be ashamed of wearing old clothes in war time. Don't keep more servants than you really need." Personally, we are never ashamed of wearing old clothes on a motor cycle, even for "pleasure" purposes. The other "Don'ts" don't concern us!

Sec.-Lt. H. Hegan, who enlisted in No. 5 Battery of the M.M.G.S. during 1914, and has recently been granted a commission.

## THE NATION'S PETROL SUPPLY.

### A Possibility of Petrol Permits.

**W**HILE there has been no actual shortage of petrol in this country, and those in the South have had more than enough, it has occasionally proved difficult to procure it in the North, chiefly because the distribution has not been so well carried out. What concerns the motor cyclist at the present time is the possible restriction which may be imposed on the use of motor cycles. At the moment no definite news is obtainable, but motor cyclists should not be surprised to hear that petrol cards will be issued, upon which will be written the amount of fuel allotted to, and purchased by, each motorist during a given period, say a week or a month. Without showing the card it would be impossible to procure petrol, and the vendor would in each case write down the amount sold.

We can hardly think that the Government will prevent people using their motor bicycles to take them to the station, or to take them on their daily business rounds, nor would they grudge the petrol spent in taking out wounded soldiers for an outing in the country. It is likely, therefore, that for a purpose such as the latter an extra allowance of petrol would be granted. We should imagine that each motor cyclist who is able to get his business done on his allowance will not be denied the use of what is left for pleasure purposes, if he feel so disposed. All this, of course, is very indefinite, but we hope that soon the motor cyclist will really know how matters stand.

There are now quite a number of journals published in the war zone by amateur journalists serving at the Front. The latest of which we have received a copy is called *The Strafer*, written and printed by the men serving with an A.S.C. Ammunition Park attached to G.H.Q. The contents include information of the doings of the section and much humorous matter.

### A BIG SINGLE-CYLINDER.

The 1916 4½ h.p. 650 c.c. Excelsior, with countershaft three-speed gear. This type of machine will appeal to those desiring a powerful yet simple sidecar mount.

# The Action of a Four-s

## The General Construction and Working Operation of a Motor Cycle

**I**N giving the following sectional illustrations and description of the four operations in the working of a four-stroke single-cylinder motor cycle engine, we have in mind the many newcomers and prospective newcomers to the ranks of motor cyclists, very many of whom, we know, have little or no knowledge of the inside construction and working of the petrol engine. The four-stroke engine is so named owing to the fact that in order to obtain one power stroke the piston has to perform four separate strokes, which means that the flywheels have to rotate twice to complete the cycle of operations. The main parts of an engine are as follow :

*The Cylinder.*—An inverted metal cylinder, closed at one end. It is usually constructed of cast iron, but sometime of steel. On the outside of this are cast a number of metal fins known as *radiators*; these are for the purpose of conducting away the heat generated when working. At the closed end are situated the two valves (*exhaust* and *inlet*) and the *spark plug*. This portion of the cylinder is known as the *combustion chamber*, being the part where the explosions take place.

The *piston* is the inverted jar-shaped portion, also usually constructed of cast iron; this works in the cylinder, practically forming a pump. This piston is connected to a met

Fig. 1.

### INLET STROKE.

Piston descending—inlet valve open—petrol gas being drawn from carburettor into cylinder

Fig. 2.

### COMPRESSION STROKE—

Piston rising—both valves closed—gas being compressed into small space at top of cylinder.

**F**IG. 1 shows the first stroke of the engine, known as the induction stroke. It will be seen that the piston is descending. The cam situated on the left-hand timing wheel has lifted the inlet valve from its seating. The suction caused by the descending piston is drawing air through the carburettor—the instrument seen on the left. This, on its way, picks up a proportion of petrol vapour, and the whole enters the cylinder in the form of explosive gas. The inlet valve, owing to the shape of the cam, does not arrive at its full opening until the piston has descended about one quarter of its stroke. It remains wide open until

the piston has covered about threequarters of its travel when it commences to close, and by the time it has reached the end of its downward travel the valve has completely closed, leaving the whole cylinder full of petrol gas.

Fig. 2 shows the commencement of the compression stroke. The piston is now rising, and it will be seen that both valves are closed; therefore the gas which has been drawn in is being compressed into a very much smaller space, thus rendering it much more explosive. Just before the piston reaches the top of this stroke an electric spark is caused to jump across the points of the spark plug, igniting the cor

# Simple Single-cylinder Engine.

described in a Simple Manner for the Benefit of the Beginner.

rod known as a *connecting rod*. This again is attached to the *crank*, which is usually formed between the two *flywheels* situated in an airtight case known as the *crank case*, generally made of aluminium. The bearing where the piston is attached to the connecting rod is known as the *small end* bearing, while the lower bearing attached to the crank is called the *big end*, and is now frequently of the roller type shown in the illustrations. The two bearings supporting the crank and flywheels are designated the main bearings.

The *timing gear*, or two to one gear, consists of gears with exactly double the number of teeth as the pinion which drives them; they therefore rotate at half the speed

of the engine. On these gears are mounted the *cams*, which are pieces of metal with about one-quarter of their periphery raised above the general surface, and by means of these cams the valves are lifted when necessary. They are held closed normally by means of strong springs. The *magneto*, which generates the electricity for the spark, also runs at half engine speed.

The *carburettor* is the instrument attached to the inlet port by means of which the petrol is converted from a liquid into a gas by spraying it and mixing it with air. It consists of two parts, the float chamber and the mixing chamber.

Fig. 3.

## FIRING STROKE.

Spark occurs at plug points—mixture explodes—piston being forced down—exhaust valve will open when piston is half-inch from bottom of stroke.

Copyright illustrations of The Motor Cycle

Fig. 4.

## EXHAUST STROKE.

Piston rising—exhaust valve open—burnt gas, indicated by arrows, being forced out of cylinder into silencer, and thence into atmosphere.

pressed gas, which then expands with considerable violence, forcing the piston down. (See fig. 3.) The power thus developed is transmitted *via* the piston and connecting rod, and causes the flywheels to rotate. This downward stroke is known as the explosion, or power, stroke.

When the piston has descended to within about half an inch of the bottom of this downward stroke the exhaust valve—the right-hand valve—will be just beginning to lift from its seating, and, although the piston will still be descending, a large amount of the burnt gas will commence to escape. The exhaust cam is always made a little longer

than the inlet cam, so that the exhaust valve is held open for more than one complete stroke of the piston.

The inlet valve remains open while the engine turns through 180° or 185° and the exhaust for 225°.

The next upward stroke of the piston, the commencement of which is seen in fig. 4, is known as the exhaust stroke, as the piston in its upward travel forces all the remaining burnt gas out of the cylinder through the exhaust port and into the silencer. The exhaust valve closes directly the piston reaches the top of the exhaust stroke; the inlet valve again opens, and the sequence of operations is repeated.

## ON DUTY.

Some Impressions and Experiences of a  
Motor Cyclist on Active Service.

**Y**ES, gentlemen, I am a hero, thank God! A hero of the purest water. No, sir! I was not at Ypres or in the retreat of Mons. In fact, I have never been in the danger zone, *proprement dite*. I have no story of bursting "Marmites" or holding up ten Boches with a cycle pump, yet I am as much entitled to the V.C. or the D.S.O. as any honoured despatch rider up-country.

I, too, am a despatch rider, although unkind friends call me a motor cycle orderly; I am attached to the advanced M.T. depot in one of the most important cities in France, working from 7 a.m. till midnight, riding in all weathers over the most God-forsaken *paré* that ever found its place in the sun.

Before revealing the dangers and perils of this heroic work I will initiate you in how to become a D.R.

The greatest moral asset is patience. Far away from the roar of battle one is inclined to vegetate, chiefly owing to the linger-longer waiting. Of course, unkind friends call me *blasé*, but to this a thousand denials. I am as misjudged as our old friend Bluebeard. He had as much right to slaughter his faithless wives as I have to slay with a coal hammer a faithless sparking plug.

*Voilà* a man with a secret in a closet and implicit faith in woman. What his secret was concerns us as little as it should have concerned his wife. It was probably a design for a motor cycle with a hookah carburetter, and he was off to the Patents Office to get his ideas covered. History relates that he came back in a bad temper because the rajah had not built a Patents Office, and could only offer him monopoly rights. His price was exorbitant. Five hundred silver khran, five hundred head of cattle, seven wives, twenty black slaves, and a King Dick spanner. Of course, he would not dib up, and we all know what happened to his wife when he returned and found out what she had been doing—prying into his closet and probably upsetting the steel and flint ignition timing.

### A Busy Life!

But I am wandering away from my story.

Here I am outside the office sitting in the gutter of the street, which the French girls next door call the "Brook" in their notes to me, waiting for despatches (and notes). It is terribly hot, and as I smoke a 25 centime Manilla cigar I gaze upon the five machines leaning idly against the kerb, waiting

for riders with despatches and perspiring petrol. Four of these motor cycles are in spick and span condition; even the nickel has been rubbed up. Of course the owners have nothing to do, whereas I am too busy to believe that a machine goes better because of stroking the mudguards with a wet sponge. The waiting makes me very bored. Of course I could get away for an hour or so on a joy ride (*alias* test), but my compression is rather poor for speed.

*Parbleu!* I have just been saluted by a Tommy. Saluted his superior officer sitting in the gutter. I am really only a private, but it is the moral duty of every D.R. to get himself up as like a hossifer as pos., with a cap badge darkened by French sulphur matches (wear your smoke helmet), the short coat issued, breeches, and leggings.

Motor cyclists out here also have a fashion of their own. *Noblesse oblige*. For instance, you must have knee pads, a Klaxon, a very noisy exhaust, umbrellas over sparking plugs, and T.T. handle-bars.

### Practical Jokes.

When calling, say, at the G.P.O., and another rider arrives and leaves before you in a hurry, be sure to examine your machine ere you bestride it. Something has been cooked. Either your petrol has been turned off, a pin in the h.t. wire touching frame, a cardboard disc behind gauze air intake, sugar in petrol, or compression cocks opened. One morning I opened the cocks of a Douglas left outside an office, thinking it was the machine of my blackest rival. However, it belonged to an officer, and when I passed him in the afternoon he still had those cocks open.

A head appears at a fourth storey window and bawls out "Orderly," so up the stairs I toil. Up, up, and up. How I know that winding staircase. Fifty-seven steps and a thick mat on the top! I have told him before to call me "Despatch Rider," but it boots him naught.

The order is to proceed to one of the swaggiest hotels in the town to inform a colonel that his presence is requested at the Base. He knoweth not the way, and asks me to direct him. Turning to his chauffeur, I overhear him say, "Follow behind this, er—officier, who will kindly show us the road."

And before entering the hotel I had said to the selfsame driver, "I say, old sport, is your bloke inside?"

## AMONG THE ACCESSORIES.

### An Acetylene Burner Cleaner.

A USEFUL accessory lately placed on the market by Messrs. Herbert Terry and Sons, Ltd., Redditch, the well-known spring manufacturers, is

a wire brush for the purpose of cleaning acetylene burners. The brush has about forty wires of a diameter sufficiently fine to be inserted in the hole of an acetylene burner. It is held firmly in a closely coiled spring, which screws securely into a steel spring cover. When closed it is only 1½ in. long, and has a ring at one end, so that it may be suspended from a key chain or key ring. The price is 3d.

### The J.W.B. Valve Truer.

THE J.W.B. valve truer, which is sold by Selfridges, will appeal to the amateur having his own workshop. To keep the valve in position the door at the forward end is opened, and the valve is pushed in from that end stem first, it having been first ascertained that bushes corresponding with the diameter of the valve stem are inserted in the uprights. The door is then closed, and the pin inserted; next the

A valve truer that will appeal to the many riders who wish to keep their machines always in tip-top tune. It is sold by Selfridges.

handle is placed in position, and the adjustable stop at the forward end is screwed up. This serves to keep sufficient pressure on the face of the valve against the cutter. A tool of this kind, intelligently used, should be most useful for the private owner who does not possess a lathe, as it saves much grinding down of the valve seatings. Complete with the tool are supplied six different sizes of bushes to suit valves with stems of various diameters.

### Some Taylor Accessories.

QUITE a practical accessory which should appeal to the touring motor cyclist is a kit bag, which is just the size to be conveniently carried on the luggage grid. It has two compartments, in one of which may be carried a sponge bag and other odds and ends, and in the other a suit of pyjamas and spare under-clothing. It is made in proofed material, lined with oilskin, and should be completely waterproof.

Now that petrol has gone up so much in price it behoves all motor cyclists to take especial care not to waste the precious liquid. To this end Messrs. Taylor and Co. are specialising in a pourer designed to screw on to any petrol can. A filter and can opener is incorporated in it, and by its aid a can of petrol may be opened and emptied to the last drop without any waste from spilling, splashing, or evaporation—a worthy addition to the tool kit.

The Taylor double compartment kit bag.

Quite a useful preparation for sidecar bodies is Johnson's prepared wax, a preparation we have tried before on bodywork, and which may be relied upon to give a remarkably fine gloss to any body that, after long use, has assumed a dull appearance.

The above three mentioned articles are marketed by Messrs. H. Taylor and Co., Ltd., 21a, Store Street, Tottenham Court Road, W.C.

### A Pair of Practical Gauntlets.

AN objection to many gauntlets is that they take up so much room when folded into the pocket. Those sold by Messrs. the Bancroftian Co., 64, Bishopsgate, E.C., completely overcome this difficulty, as they are capable of being folded in the manner shown in the illustration. Their quality is excellent, and the leather is very soft and pliable.

Other specialities of the Bancroftian Co. are a good motor cycle waterproof suit, which is guaranteed to withstand the heaviest rains, and a woven leather body belt.

Bancroftian folding gauntlet gloves.

## Average Prices OF Second-hand Machines.

WE give below the average prices of second-hand models offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model the average for the past week is quoted, otherwise the last average is given.

Make.	Year.	H.P.	Average for last week.	Latest average obtainable

## LETTERS to the EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

at this speed. Owing to the splendid steering this is quite easy to do.

The machine was used practically the whole time for despatch riding, and I never had a breakdown, although I only remember cleaning it about three times. On a cold morning the oil was very slow in coming out of the oil tank, and the back brake block wore out very quickly; also, the petrol lubrication was rather messy. Everything considered, however, I cannot imagine a more charming machine to ride, as its hill-climbing powers are phenomenal for a 225 c.c. engine, and it also has a good turn of speed—about 42 m.p.h. being its maximum, I think.

Since coming out here I have been riding a 1914 Triumph with a hub gear. This has proved a most reliable machine and has carried me about 8,000 miles, but I still prefer the Baby two-stroke.

GEOFFREY W. HILL.

(B.E.F.)

### Diesel Engines for Motor Cycles.

Sir,—Now that petrol has reached such a high price, would it not be advisable for our engineers to turn their attention to the Diesel engine as a means of motive power for motor cars and motor cycles?

I am not an engineer myself, so do not understand the possible difficulties in the way of this, but it seems to me that if they could be overcome we should have a marvelously cheap machine, seeing that the Diesel engine runs on crude oil, and would do away with all electrical ignition.

I should be glad if some engineer acquainted with the above engine would give us his views on the matter.

CHEAP FUEL.

### New Machines for Old.

Sir,—I enclose two photographs of a renovated Humber motor cycle rescued from the scrap heap. This was originally an inclined engine, and I thought it might interest some of your readers.

The alterations altogether cost about £25, all the work being done by myself, including cutting down the frame, making an extra stay for holding engine vertically, the cradle for the engine and magneto, etc. It makes a very compact machine, and brings the bicycle up to date. I have had two or three offers of £20 for it since it was finished.

W. WEBB.

### Baby Two-strokes up Freak Hills.

Sir,—With regard to "Ixion's" casual comments in your issue dated February 24th, I should like, as he suggests, to name a very steep hill which my small two-stroke will climb. I have a 1914  $2\frac{1}{2}$  h.p. Levis, 293 c.c., single gear, whose ratio is  $5\frac{3}{4}$  to 1. This machine will take me up a well-known gradient called Chances Pitch, which is on the Colwall side of the Malvern Hills, almost at the foot. At the steepest part of the hill there is a very nasty corner, and when this has been passed the rider has by no means completed his task; he has yet to go about threequarters of a mile up this steep gradient before he finds himself at the summit of the Malvern Hills, just near the historic British Camp. The Levis will only take me up this if my B. and B. carburetter is adjusted properly. I find that makes an enormous difference to my two-stroke (as "Ixion" says) in the matter of power on hills.

I hope you will have room in your splendid journal for this letter, as I think this performance is very creditable to my little machine, considering it is single-gear, and has been ridden a very long way. C.L.W.

Sir,—As "Ixion" asks for experiences of the hill-climbing powers of two-stroke "Babies," I am sending you mine. My machine was a Junior Triumph, delivered January 19th, 1915, and sold about April 12th (when I came out here), after covering slightly over 4,500 miles. The steepest hill of note which I climbed was Sutton Bank, which has an average gradient of 1 in 8 for nine-tenths of a mile, the steepest bit being reputed to be 1 in 3.9. This the Baby climbed easily after a non-stop run of over thirty miles. Gears,  $5\frac{3}{4}$  and  $8\frac{3}{4}$  to 1, with 24in. wheels.

My fastest run was from near Harrogate to Doncaster, a distance of forty-two miles, in 1h. 19m.—an average of over 31 m.p.h. At ordinary touring speeds I could get 95 m.p.g., sometimes 105.

The vibration at over 37 m.p.h. was very objectionable, and I found it advisable to take the hands off the bars

An old chain-driven Humber which has been modernised by Mr. W. Webb. (See letter on this page.)

### Converting Acetylene Lamps for Electric Lighting.

Sir,—Having noticed in recent issues of *The Motor Cycle* several interesting methods for converting existing acetylene lamps into electric, I am sending you sketches of a simple and very neat device which I have made at a very small cost for altering my Lucas head lamp.

The following is the procedure to adopt: Take a 3in. gas tee piece and saw it off as shown. File out the inside until a small screw lamp holder will fit tightly into the tee piece. Next get a piece of brass tube (3in. or 4in. long according to size of head lamp) and screw and fit two nuts at the bottom end for attaching to lamp. Drill a hole to allow the insulated wire to come through to the terminal on holder. The frame provides the return path for the current. Fitted with a four-volt miniature bulb it will give a very good light with the lamp facing the mirror and reflecting forwards. The fitting can be silver plated if required and looks very neat.

E. SIMKISS (SEC.-LT.).

### The Removal of Cylinders.

Sir,—We were interested to note the particulars of a patent in your issue of the 17th ult., by F. E. Etwell, Toronto, Canada, showing the tank and tube so designed as to be detachable, and allowing for the easy removal of motor cycle cylinders.

We, like many other motor manufacturers, are engaged to our fullest capacity on war work for Government purposes; consequently our motor cycle business has, more or less, to stand on one side. It must not, however, be thought that we have put aside our interests in the improvement of motor cycles. We have a machine which has now been running some ten months, and which has done several thousand miles, which is fitted with a detachable bar, identical to the particulars given in the patent above mentioned. This, we think, may be of interest to some of your readers. The development of this frame is only a matter which is held up by the present war conditions.

THE REX MOTOR MFG. CO., LTD.

GEO. H. HEMINGWAY, Managing Director.

Sir,—In your issue of February 17th you illustrate a motor cycle frame with a patent detachable tube under the tank. I would like to say that I have had such a bar in use for some years on a Rex loop frame, but I added this for strengthening purposes, as the frame mentioned had no tube in this position. To secure rigidity I designed the bar with

end clips brazed to angles suitable to the down tubes, and it is adjustable as to length by a sliding attachment with clip and bolt.

### VARIABLE GEARS.

In the same issue you show on page 164 a variable gear, which is very similar to one which I designed about eight years ago, but the medium in mine was thick-oil, instead of the small steel balls. My arrangement consisted of an epicyclic gear, with suitably arranged oil chambers and valves, and combined free engine, clutch, infinitely variable gear to direct drive, reverse and brake, and was designed for car use to be situated between the engine and propeller-shafts.

I gave the idea up, however, as I came to the conclusion that the whole thing worked more as a friction clutch than as a true gear, which I think will be found to be the case with the one you illustrate.

W. LEICESTER

### Spring Frames in Australia.

Sir,—I was considerably interested in your account of the Whiting spring frame, as detailed in *The Motor Cycle* of November 11th, 1915. It seems to me that the designer is on the right track.

I have now used my motor cycle (a 3 h.p. twin Enfield) for about 6,000 miles on Australian roads and bush tracks. It says a lot for the frame of the machine that it has stood the strain so well. But with a spring frame, such as the Whiting, I could maintain a higher average of speed with increased comfort and less wear and tear to the machine and rider. This is particularly the case in night riding, when we can less easily dodge the pot-holes.

It is like old days reading *The Motor Cycle* again. I read it at home *ab initio* until the summer of 1912. Recently I have rejoined the ranks, and am glad to see "Ixion" is going as strong as ever.

Might I add my small "squeak" to the chorus of discontent anent charges for spares for English machines and engines out here? I understand the users of American machines get very different treatment. Is this a tax on our patriotism? If so, could you spare a moment to drop a bombshell into the ring of those who are exploiting the market out here?

I wish you and *The Motor Cycle* every success, in particular your present campaign in favour of the spring frame.

(DR.) J. S. WATSON.

DUDLEY, NEW SOUTH WALES.

### Rotary Engines on Motor Cycles.

Sir,—I am a constant reader of your paper, and the interest with which you have invested the important question of rotary engines for motor cycles has encouraged me to submit an effort in this direction, which I enclose, and hope it may prove interesting to your readers. I am a well-known Belgian racer and pace-maker, also the chief in a big aeroplane construction works.

PARIS.

AUGUST GAETHOFS.

M. August Gaethofs, the writer of the letter on rotary engines. His design for a five-cylinder rotary engine situated in the rear wheel of a cycle is shown.

### A Drip Feed Improvement.

Sir,—I enclose sketch of an improvement I have made for the top of a drip feed regulator, which may be of use to your numerous readers. It is very difficult to adjust the drip feed in the dark and very often in daylight, as the oil frequently obliterates the figures. I have made a pointer of a piece of tin brass, drilled a small hole in the end just sufficient to allow the centre screw to pass through, and fixed pointer in "off" position. This can be adjusted in the dark, as the pointer will turn with the milled-edged regulator, and can be felt for position even with driving gloves on; and should extra oil be required over a certain route the drip feed can be regulated and replaced without risk of running dry or flooding.

SYDNEY J. FAIRLIE.

### A Suggested Electric Outfit.

Sir,—Without a doubt "Engineer" strikes the keynote to progress in the electrical equipment of motor cycles in combining lighting with ignition by transformer.

A dynamo—or generator, as "Engineer" prefers to call it—which need not weigh more than 6 lb. complete, will not only supply sufficient current for ignition, but at least six times as much as is required for that purpose, leaving the remaining five-sixths to be stored up for lighting. The case for combining the functions of two electrical generators in one machine is very strong, especially in the case of light-weights, where considerations of space and additional weight are all-important. Indeed, it is quite possible that these will be the determining factors after the war, when riders of lightweight and leviathan alike will clamour for electrical equipment.

I have been experimenting exhaustively during the best part of three years in the direction indicated by "Engineer's" letter, and he will therefore perhaps not resent a little criticism prompted by actual experience.

Disregarding for the time being the question of electrical starters as being unlikely to undergo satisfactory development for motor cycles, the wiring shown in the drawing accompanying "Engineer's" letter can be considerably simplified. To deal with the ignition circuit first, so far as the sinusoidal effect of alternating current is concerned, this is of no value in the present case, as it does not give that sudden and absolute collapse of the magnetic flux necessary to produce the hot spark required. Again, if the tappings off from armature to slip-rings are at the most advantageous angle, i.e., 180°, the potential difference even at the crest of the pressure wave would only be equal to that on the direct

current side. Added to this there is also the undesirable necessity for synchronism between the engine and generator, which eliminates the possibility of using that highly satisfactory drive for vehicle dynamos—the Whittle belt. As, therefore, the direct current delivered by a dynamo of ordinary construction will do all the work required, there would not appear to be any need for the complication of two separate circuits and duplicate sets of brush gear. The primary leads from the transformer (now our old friend the non-trembler coil" under a more scientific name) can be taken direct from the terminals of the generator—which should also be made integral with the automatic cut-out—so that it would be fed by the dynamo at ordinary speeds, but would have the help of the battery at low speeds and starting up. Now sweep away the whole of the negative wiring, substituting so-called "earth return"; put a con-

denser across the contact breaker, and the whole system is reduced to the simplicity shown by the diagram above. This is incidentally exactly as used by the writer since the early spring of 1914, with the exception that all connections are brought to a switchboard fitted with dynamo and lamp switches and a combined volt and ampere meter.

The single wire system may be regarded by the uninitiated as a weak point, but in many ways it is the strongest point in the whole system. Although not general in this country for vehicle lighting it is employed in the States in some of the highest class equipments, including that manufactured by the Westinghouse Co. Putting all other advantages aside, the neatness of the single wire system for motor cycles, where all wiring is more or less in view, is a point well worthy of consideration.

G. E. MORTLEY.

### Paraffin as a Fuel.

Sir,—I have read with interest the letters in your valued journal re using paraffin as fuel. I cannot understand the writers finding paraffin of any use, and I can only imagine that the advocates are simply riders who have found that paraffin will drive the engine. I spent much time in fixing up my 6 h.p. combination with two tanks, etc. The motor went, but I defy anyone to prove that it pulls well on a gradient, for the simple reason that the engine cannot be kept cool. Paraffin will do for lorry work with an elaborate water cooling arrangement. It took me a long time to get rid of the effects on valves, etc., and all I can say is that I do not intend to try paraffin again. I go 55 m.p.g. four up, and anyone who cannot afford this had better give up motor-ing. The difference in price between petrol and paraffin will be found to be nothing as compared with the loss in value of the engine after a few months' running. Every part of the engine will be badly worn. Another point, the smell when using paraffin was shocking. To use paraffin in an ordinary high-class motor engine is sheer abuse, and I wonder that makers of engines have not answered these letters.

T. H. WARD.

### APPLICATION TO JOIN THE MOTOR MACHINE GUN SERVICE.

Name .....

Address .....

Chest measurement ..... Height .....

Group No. .... or Age .....

Class No. ....

How long have you been a motor cyclist? .....

Can you execute running repairs? .....

Are you medically fit? .....

Occupation .....

WHAT DATE CAN YOU JOIN UP? .....

After filling in the above particulars return to:

MR. GEOFFREY SMITH,  
Inspecting Officer,  
19, Hertford Street,  
COVENTRY.

[Issue March 9th, 1916.]

Read carefully the instructions on page 229 of the Recruiting Section.

A selection of questions of general interest received from readers and the replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" on the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### Rotating Engine without High-tension Wire.

**?** On testing the engine by pedalling to ascertain freeness, etc., is any harm done to the magneto by detaching the high-tension wire to the plug to prevent the engine firing? I am told harm is done to insulation. Is this correct?—C.L.

It is not a good plan to test the engine for any length of time by pedalling with the high tension wire detached unless the terminal is resting against some metal part of the frame or the engine, which will so allow the high-tension current to return without causing damage.

### Absence of Spark.

**?** My machine is a 1913 3½ h.p. single with a B. and B. carburettor. Owing to the bad state of the weather I have not ridden my machine for four weeks and so stored it in a shed. The other day, however, I thought of having a short tour, but when I got the machine out it was damp, and I could not start the engine. I then tried it on the stand, but with no success. Having in my possession the "Hints and Tips for Motor Cyclists," I paid attention to the sparking plug. I cleaned and rubbed it with petrol and adjusted its points, etc. The valves were both sound and working smoothly and timed correctly. The jet was also quite clear. Fearing a damp magneto, I warned it by putting a flame under it; carbon brush in proper condition. I tested for a spark, but could not see a sign of one, though the current is felt when turning the back wheel. When placing the plug on the cylinder and turning the wheel, should the spark be visible? When pushed along the engine turns freely, and all seems to be in working order. Before being laid up four weeks ago the machine worked splendidly.—J.E.

It is more than likely that your trouble is caused through the small rocker arm of the contact breaker sticking in its bearing due to the small fibre brush becoming swollen by the damp. This frequently happens when the machine has been laid up for some time during damp weather. If this is the case you should remove the rocker arm and free the bush by rubbing it with emery cloth wrapped round a match. We should advise you not to heat the magneto to dry it. If you suspect damp it should be stood in a warm room. Yes; the spark is visible if the back wheel is pulled over sharply. Care should, however, be taken that only the metal body of the plug is resting on the cylinder of the engine.

### Lack of Power.

**?** I shall be glad if you can say what is the matter with my 2½ h.p. horizontal twin. It is a late 1913 model. I have ridden about 20,000 miles. The engine was cleaned of carbon deposit in April, and in October began to slow on the hills, so I have had it taken to pieces by a man who does my work, and he found a quarter of an inch of carbon on the piston heads. Naturally, I thought I was going to fly once more, but, to my amazement, the machine will hardly climb at all. Unless I get a good run I cannot get over a canal bridge on top. Hills I used to fly up I can only get half-way, then drop to low. Often when I change down the engine will slow and finally stop, and the only way I can get going again is to put the engine in free, use the kick starter, and race it; after that the engine will go. The compression on the back cylinder is good, front cylinder very poor, so two new rings have been fitted, but with no better result. Plugs—Good. Spark—Excellent. Magneto points—Good, flat, and correct distance. Carbon brushes—Flat, clean, and springs good. The distributor the brushes bear against is quite clean. Tappets—Correct distance. Valves—All ground to their seatings. Carburettor—Been taken to pieces, everything quite clean, no stoppage of any kind. Jet used, 25. (I have since tried from 24 to 28, but 25 gives best results.) I used to get 120 m.p.g., but now only 80 m.p.g. All joints have been coated with thick oil, but no bubbles, however slight, appear. Timing—Never been changed or touched. Machine travels well on the level.—J.R.

Your trouble is certainly a curious one, as you have apparently tried practically every possible thing that can be wrong; but, of course, there is no doubt that there is some small fault which you have overlooked. We would recommend you to go over the machine systematically. Make sure that all the piston rings are a good fit and are not stuck in their grooves, that all the valves are free in their guides, and the springs are suffi-

ciently strong. You should go over all the other adjustments you have mentioned and make absolutely certain they are in order, and you should be sure there are no air leaks in the induction pipe. Bind all doubtful joints with insulating tape. Are you sure you are giving sufficient lubrication? The front cylinder on these machines is very apt to get starved, and it is usually this that causes the compression to be poor in the front cylinder. A considerable improvement in power will probably be noticed after the new rings have been run in.

### Hub Gear Sluggish Change.

**?** (1.) What can be wrong with my 1914 4 h.p. combination (three-speed hub) which has developed the following trouble: When on a fairly steep hill, and I wish to drop to middle or low gear, the exhaust valve is raised momentarily, according to instructions, and the gear lever moved to low or middle gear; the engine still appears to labour somewhat, and about ten or twelve seconds later a jerk takes place, and the engine only then is in low or middle gear. Now, this must be a severe strain on the engine, as the exhaust is dropped again, and the gear lever, of course, moved to the required position some time before the gear change takes place. (2.) Regarding the above-mentioned three-speed hub, sometimes on starting on low or middle gear from a standstill the clutch pedal is fully released, and yet the clutch does not grip until a few seconds later. The above points to a slipping clutch, and yet when the clutch is in, the rod is quite slack and moves ¼ in. before pressure commences to take the clutch out.—A.H.

(1.) We are afraid this question is not particularly clear. We can only think that the gear does not engage the moment the lever is pulled over; therefore, we should recommend you to change a little early, holding the exhaust up while the machine is slowing down, and then drop it. By that time we think you will find that the gear is fully engaged. The special symptom might be caused by changing a little too quickly, and not allowing the speed of the machine to fall to the speed at which it would be naturally propelled by the lower gear into which you are changing; or it is possible that the striker needs adjustment, or the spring actuating the moving parts is either broken or has lost its strength. Try washing the gear out thoroughly with paraffin, afterwards re-oiling with clean oil. (2.) The clutch might be washed out with paraffin and a little thin oil put in. This will probably improve matters.

THE  
MOTORCYCLE

ANNUAL SPRING NUMBER

WILL APPEAR ON

Thursday, April 13th.

**Drying a Magneto.**

**?** My old motor cycle has since August, 1914, been stored in a shed that is very damp, and I am now afraid to try it unless the magneto is dried out properly first. At what temperature should it be dried? Would a temperature of 200° Fahr. be too great for a Bosch magneto condenser?—P.S.

We see no reason for you to have to dry the magneto unless you are unable to get a spark at all. If the machine refuses to spark, and you suspect moisture, then, of course, it will be necessary to dry it. We would not advise you to submit the machine to a greater heat than about 120° Fahr. Unless you are in a hurry, we think you would find it sufficient simply to store the machine in a warm room for a few hours.

**Occasional Seizure.**

**?** I have a 1915 6 h.p. A.J.S. motor cycle, which I use in conjunction with a sidecar, and I have been troubled with an inexplicable difficulty ever since I had the machine in July last, and I should be very glad to have your advice on the matter. The trouble is temporary seizing of the front piston or the top ring; this invariably happens on a big throttle opening when driving up hill on top gear, or when doing any hard driving. The seizure is only momentary, and the engine starts up again immediately, and runs again quite sweetly and develops its usual power; also if the throttle is kept on a small opening the trouble is not apparent. After the first temporary seizing experienced I had the cylinders down, and noticed that the top ring of the front piston was stuck, and it was taken from the groove and thoroughly cleaned; but I also noticed that it was a very tight fit in the groove. I then eased the ring in order to make it a looser fit. I have now had this cylinder down several times; that is, on each occasion that I have experienced seizing, and the ring is eased off a little each time, until it is now quite a loose fit. The trouble has been more pronounced during the last few days, although I have been oiling copiously with Vacuum BB, as advised by the makers, and give two and a half pumpfuls in eight miles, until I get a smoky exhaust at times.—J.O.J.

We certainly think that your trouble is due to the fact that the front cylinder does not get enough oil. We should therefore recommend you, if possible, to have a connection so that a small quantity of oil flows direct to the front cylinder and adequately lubricates this piston separately. We think you would find this fitting satisfactory. As the ring now seems to be quite a loose fit in the piston grooves you should make sure that it is not a tight fit in the cylinder itself; when

the ring is fitted in the cylinder there should be about  $\frac{1}{2}$  to 1 mm. clearance between the two ends to allow for expansion. Make quite sure the lower rings are also an easy fit.

**Priming the Cylinder.**

**?** I should be obliged if you will kindly answer the following questions: (1.) What is the real object of injecting petrol when starting a motor cycle from cold? Is it to free gummy piston rings, or to ensure that there is petrol vapour to fire as soon as a spark occurs at the plug points? (2.) Is there any harm in injecting too much petrol into the cylinder at starting? Some makers say a few drops; others state in their catalogues, do not be afraid to inject plenty of petrol to ensure an easy start.—W.R.M.

(1.) The petrol performs the two functions—it frees the gummy piston and also leaves a certain amount of petrol vapour in the combustion chamber. (2.) It is best not to inject too much petrol, as it washes away the lubricating oil. Just a squirt out of an oilcan is quite enough.

**Unable to give Full Throttle.**
